

Db2 12 for z/OS

Command Reference

Notes

Before using this information and the product it supports, be sure to read the general information under "Notices" at the end of this information.

Subsequent editions of this PDF will not be delivered in IBM Publications Center. Always download the latest edition from [PDF format manuals for Db2 12 for z/OS \(Db2 for z/OS in IBM Documentation\)](#).

2021-07-29 edition

This edition applies to Db2® 12 for z/OS® (product number 5650-DB2), Db2 12 for z/OS Value Unit Edition (product number 5770-AF3), and to any subsequent releases until otherwise indicated in new editions. Make sure you are using the correct edition for the level of the product.

Specific changes are indicated by a vertical bar to the left of a change. A vertical bar to the left of a figure caption indicates that the figure has changed. Editorial changes that have no technical significance are not noted.

About this information

This information describes numerous commands that system administrators, database administrators, and application programmers use. The commands are in alphabetical order for quick retrieval.

Throughout this information, "Db2" means "Db2 12 for z/OS". References to other Db2 products use complete names or specific abbreviations.

Important: To find the most up to date content for Db2 12 for z/OS, always use [IBM® Documentation](#) or download the latest PDF file from [PDF format manuals for Db2 12 for z/OS \(Db2 for z/OS in IBM Documentation\)](#).

Most documentation topics for Db2 12 for z/OS assume that the highest available function level is activated and that your applications are running with the highest available application compatibility level, except for the following section that describe the migration process and how to activate new function:

- [Migrating to Db2 12 \(Db2 Installation and Migration\)](#)
- [What's new in Db2 12 \(Db2 for z/OS What's New?\)](#)
- [Adopting new capabilities in Db2 12 continuous delivery \(Db2 for z/OS What's New?\)](#)

The availability of new function depends on the type of enhancement, the activated function level, and the application compatibility levels of applications. In the initial Db2 12 release, most new capabilities are enabled only after the activation of function level 500 or higher.

Virtual storage enhancements

Virtual storage enhancements become available at the activation of the function level that introduces them or higher. Activation of function level 100 introduces all virtual storage enhancements in the initial Db2 12 release. That is, activation of function level 500 introduces no virtual storage enhancements.

Subsystem parameters

New subsystem parameter settings are in effect only when the function level that introduced them or a higher function level is activated. Many subsystem parameter changes in the initial Db2 12 release take effect in function level 500. For more information about subsystem parameter changes in Db2 12, see [Subsystem parameter changes in Db2 12 \(Db2 for z/OS What's New?\)](#).

Optimization enhancements

Optimization enhancements become available after the activation of the function level that introduces them or higher, and full prepare of the SQL statements. When a full prepare occurs depends on the statement type:

- For static SQL statements, after bind or rebind of the package
- For non-stabilized dynamic SQL statements, immediately, unless the statement is in the dynamic statement cache
- For stabilized dynamic SQL statements, after invalidation, free, or changed application compatibility level

Activation of function level 100 introduces all optimization enhancements in the initial Db2 12 release. That is, function level 500 introduces no optimization enhancements.

SQL capabilities

New SQL capabilities become available after the activation of the function level that introduces them or higher, for applications that run at the equivalent application compatibility level or higher. New SQL capabilities in the initial Db2 12 release become available in function level 500 for applications that run at the equivalent application compatibility level or higher. You can continue to run SQL statements compatibly with lower function levels, or previous Db2 releases, including Db2 11 and DB2® 10. For details, see [Application compatibility levels in Db2 \(Db2 Application programming and SQL\)](#)

Who should read this information

This information presents reference information for people involved in system administration, database administration, and operation. It presents detailed information on commands, including syntax, option descriptions, and examples for each command.

Db2 Utilities Suite for z/OS

Important: In this Db2 12, Db2 Utilities Suite for z/OS is available as an optional product. You must separately order and purchase a license to such utilities, and discussion of those utility functions in this publication is not intended to otherwise imply that you have a license to them.

Db2 12 utilities can use the DFSORT program regardless of whether you purchased a license for DFSORT on your system. For more information, see the following informational APARs:

- II14047
- II14213
- II13495

Db2 utilities can use IBM Db2 Sort for z/OS (5655-W42) as an alternative to DFSORT for utility SORT and MERGE functions. Use of Db2 Sort for z/OS requires the purchase of a Db2 Sort for z/OS license. For more information about Db2 Sort for z/OS, see [Db2 Sort for z/OS](#).

Terminology and citations

When referring to a Db2 product other than Db2 for z/OS, this information uses the product's full name to avoid ambiguity.

The following terms are used as indicated:

Db2

Represents either the Db2 licensed program or a particular Db2 subsystem.

IBM re-branded DB2 to Db2, and Db2 for z/OS is the new name of the offering previously known as "DB2 for z/OS". For more information, see [Revised naming for IBM Db2 family products on IBM z/OS platform](#). As a result, you might sometimes still see references to the original names, such as "DB2 for z/OS" and "DB2", in different IBM web pages and documents. If the PID, Entitlement Entity, version, modification, and release information match, assume that they refer to the same product.

Tivoli® OMEGAMON® XE for Db2 Performance Expert on z/OS

Refers to any of the following products:

- IBM Tivoli OMEGAMON XE for Db2 Performance Expert on z/OS
- IBM Db2 Performance Monitor on z/OS
- IBM Db2 Performance Expert for Multiplatforms and Workgroups
- IBM Db2 Buffer Pool Analyzer for z/OS

C, C++, and C language

Represent the C or C++ programming language.

CICS®

Represents CICS Transaction Server for z/OS.

IMS

Represents the IMS Database Manager or IMS Transaction Manager.

MVS™

Represents the MVS element of the z/OS operating system, which is equivalent to the Base Control Program (BCP) component of the z/OS operating system.

RACF®

Represents the functions that are provided by the RACF component of the z/OS Security Server.

Accessibility features for Db2 12 for z/OS

Accessibility features help a user who has a physical disability, such as restricted mobility or limited vision, to use information technology products successfully.

Accessibility features

The following list includes the major accessibility features in z/OS products, including Db2 12 for z/OS. These features support:

- Keyboard-only operation.
- Interfaces that are commonly used by screen readers and screen magnifiers.
- Customization of display attributes such as color, contrast, and font size

Tip: IBM Documentation (which includes information for Db2 for z/OS) and its related publications are accessibility-enabled for the IBM Home Page Reader. You can operate all features using the keyboard instead of the mouse.

Keyboard navigation

For information about navigating the Db2 for z/OS ISPF panels using TSO/E or ISPF, refer to the *z/OS TSO/E Primer*, the *z/OS TSO/E User's Guide*, and the *z/OS ISPF User's Guide*. These guides describe how to navigate each interface, including the use of keyboard shortcuts or function keys (PF keys). Each guide includes the default settings for the PF keys and explains how to modify their functions.

Related accessibility information

IBM and accessibility

See the *IBM Accessibility Center* at <http://www.ibm.com/able> for more information about the commitment that IBM has to accessibility.

How to send your comments about Db2 for z/OS documentation

Your feedback helps IBM to provide quality documentation.

Send any comments about Db2 for z/OS and related product documentation by email to db2zinfo@us.ibm.com.

To help us respond to your comment, include the following information in your email:

- The product name and version
- The address (URL) of the page, for comments about online documentation
- The book name and publication date, for comments about PDF manuals
- The topic or section title
- The specific text that you are commenting about and your comment

How to read syntax diagrams

Certain conventions apply to the syntax diagrams that are used in IBM documentation.

Apply the following rules when reading the syntax diagrams that are used in Db2 for z/OS documentation:

- Read the syntax diagrams from left to right, from top to bottom, following the path of the line.

The ►►— symbol indicates the beginning of a statement.

The —► symbol indicates that the statement syntax is continued on the next line.

The ►— symbol indicates that a statement is continued from the previous line.

The —►◄ symbol indicates the end of a statement.

- Required items appear on the horizontal line (the main path).

►► *required_item* ►◄

- Optional items appear below the main path.

►► *required_item* — *optional_item* —►◄

If an optional item appears above the main path, that item has no effect on the execution of the statement and is used only for readability.

►► *required_item* — *optional_item* —►◄

- If you can choose from two or more items, they appear vertically, in a stack.

If you *must* choose one of the items, one item of the stack appears on the main path.

►► *required_item* — *required_choice1* —►◄
 required_choice2

If choosing one of the items is optional, the entire stack appears below the main path.

►► *required_item* — *optional_choice1* —►◄
 optional_choice2

If one of the items is the default, it appears above the main path and the remaining choices are shown below.

►► *required_item* — *default_choice* —►◄
 optional_choice
 optional_choice

- An arrow returning to the left, above the main line, indicates an item that can be repeated.

►► *required_item* — *repeatable_item* —►◄

If the repeat arrow contains a comma, you must separate repeated items with a comma.

A repeat arrow above a stack indicates that you can repeat the items in the stack.

- Sometimes a diagram must be split into fragments. The syntax fragment is shown separately from the main syntax diagram, but the contents of the fragment should be read as if they are on the main path of the diagram.

fragment-name

- For some references in syntax diagrams, you must follow any rules described in the description for that diagram, and also rules that are described in other syntax diagrams. For example:
 - For *expression*, you must also follow the rules described in [Expressions \(Db2 SQL\)](#).
 - For references to *fullselect*, you must also follow the rules described in [fullselect \(Db2 SQL\)](#).
 - For references to *search-condition*, you must also follow the rules described in [Search conditions \(Db2 SQL\)](#).
- With the exception of XPath keywords, keywords appear in uppercase (for example, FROM). Keywords must be spelled exactly as shown. XPath keywords are defined as lowercase names, and must be spelled exactly as shown. Variables appear in all lowercase letters (for example, *column-name*). They represent user-supplied names or values.
- If punctuation marks, parentheses, arithmetic operators, or other such symbols are shown, you must enter them as part of the syntax.

Part 1. About Db2 and related commands

Use the Db2 for z/OS and related commands to execute database administrative functions.

These topics provide detailed reference information for Db2 and related commands, including the environment in which each command is issued, the privileges and authorities that are required to issue each command, syntax and option descriptions, usage information, and examples.

Related tasks

[Controlling Db2 operations by using commands \(Db2 Administration Guide\)](#)

Chapter 1. Commands in Db2

You can use commands for many tasks that you do to control and maintain Db2 subsystems.

Privileges and authorization IDs for commands

Commands can be issued by an individual users, by programs that run in batch mode, or by IMS or CICS transactions. The term *process* describes any of these initiators. Db2 processes are represented by a set of identifiers (IDs), which are called authorization IDs. What the process can do with Db2 is determined by the privileges and authorities that are held by its identifiers.

If RACF is active, IDs that issue commands from logged-on MVS consoles or from TSO SDSF must have appropriate RACF authorization for Db2 commands, or the primary authorization IDs must have Db2 authorization to issue commands.

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

You can use Db2 authorization to check Db2 commands that are issued from a DSN session under TSO or DB2I by using primary authorization IDs, secondary authorization IDs, and role, if the commands are running in a trusted context with an associated role.

SQL IDs do not affect most Db2 and related commands.

For more information, see [Authorization IDs \(Managing Security\)](#) and [Privileges and authorities \(Managing Security\)](#).

Command types in Db2

Db2 supports the following different types of commands:

- The TSO command DSN and its subcommands
- Db2 commands
- CICS attachment facility commands
- IMS commands
- Administrative task scheduler commands
- z/OS IRLM commands
- TSO CLISTS

For more information, see [Chapter 2, “Command types and environments in Db2,” on page 9](#).

Syntax rules for Db2 commands

For information about the conventions for syntax diagrams in IBM documentation, see [How to read syntax diagrams \(Db2 for z/OS in IBM Documentation\)](#).

The syntax of each Db2 command contains the following parts:

Recognition character

Shown as a hyphen throughout this information, with the following exceptions:

- If the command is issued from a z/OS console, the recognition character must be the *command prefix*.

The command prefix can be up to eight characters. The default is '-DSN1'. However, the majority of examples in this information assume that the command prefix has been defined as a hyphen (-). Examples involving members of a data sharing group demonstrate the use of multi-character

command prefixes, such as -DB1G. A space between the command prefix and the command is optional. For example, you can use either one of the following formats:

```
-DB1GDIS THREAD(*)
```

```
-DB1G DIS THREAD(*)
```

However, using a space makes it easier for users to identify the command, especially when the command prefix has multiple characters.

- If the command is issued from an IMS terminal, the recognition character must be the command recognition character (CRC). The command recognition character is defined in the IMS SSM PROCLIB member.
- If the command is issued from a CICS terminal or under the DSN command processor, the recognition character must be a hyphen.

Command name

The name of the command. Command names have abbreviations, which are provided in the description of each command.

Operands

Combinations of keywords and parameters that can be specified for the command.

Keywords

Sometimes called command options. Keywords can be required or optional. They must be entered exactly as shown in the descriptions of the commands.

Parameters

A keyword can have zero or more parameters. A parameter list, if present, must be enclosed in parentheses.

Separators

These can be one or more blanks or commas. An open parenthesis marks the beginning of a parameter list; no separator is needed. Optionally, an equal sign can be used to separate a single parameter from its keyword without using parentheses.

The following table lists characters that have special meanings when they are used in Db2 commands.

Table 1. Special meanings of characters in Db2 commands

Character	Meaning in commands
Blank or blanks ()	A separator. Single blanks and multiple blanks are equivalent, except in strings that are enclosed between apostrophes.
Comma (,)	A separator. Single blanks and multiple blanks are equivalent, except in strings that are enclosed between apostrophes.

Table 1. Special meanings of characters in Db2 commands (continued)

Character	Meaning in commands
Apostrophe (')	<p>The usual SQL string constant delimiter, and marks the beginning or end of a string constant in SQL. (In COBOL programs only, the QUOTESQL precompiler option allows you to choose the quotation mark as the SQL string delimiter; the apostrophe is then the SQL escape character.)</p> <p>Letters that are not in string constants are changed to uppercase. Two successive apostrophes in a string constant are changed to one apostrophe. Blanks, commas, equal signs, and parentheses in string constants are treated as literal characters, and are not recognized as separators.</p> <p>Use apostrophes to enclose options that must have lowercase characters. Beware of commands that do not convert lowercase characters to uppercase because entering lowercase letters might cause a JCL error or an abend. Similarly, entering uppercase letters where lowercase is required (UNIX Services, for example) might produce incorrect results. For more information, see Starting a system task from a console (MVS System Commands).</p> <p>An exception exists to the rule about changing letters to uppercase. If the CODED CHARACTER SET option is set to 930 or 5026, the letters are not folded to uppercase, whether in an SQL string constant or not.</p> <p>If a keyword value contains leading or following asterisk (*) or underscore (_) pattern-matching characters, and the characters in the keyword value are enclosed in apostrophes, the leading or following pattern-matching characters must also be enclosed in those apostrophes.</p>
Quotation mark (")	<p>The SQL escape character, and marks the beginning or end of an SQL delimited identifier. (In COBOL programs only, the QUOTESQL precompiler option allows you to choose the apostrophe as the SQL escape character; the double quotation mark is then the SQL string delimiter.)</p> <p>Within a string delimited by quotation marks, two successive quotation marks are changed to one. Other rules are the same as for SQL string constants.</p>
Equal sign (=)	<p>Separates a single parameter from a keyword. Thus, an equal sign is used as a separator for keywords that have only one parameter. An equal sign can be used for keywords with multiple parameters when only one member of the parameter list is specified.</p>
open parenthesis (()	<p>The beginning of a parameter list.</p>
Close parenthesis ())	<p>The end of a parameter list.</p>
Colon (:)	<p>An inclusive range. For example, (A:D) means the same as (A,B,C,D); (1:5) means (1,2,3,4,5). The colon can be used this way only in commands where this operation is specifically permitted.</p>

Table 1. Special meanings of characters in Db2 commands (continued)

Character	Meaning in commands
Asterisk (*)	<p>The meaning depends on the context:</p> <p>*</p> <p>A single asterisk as a <i>keyword-value</i> indicates "all". For example:</p> <pre>-DISPLAY UTILITY (*)</pre> <p>*keyword-value</p> <p>An asterisk as the first character of a <i>keyword-value</i> indicates that a match for the value will be satisfied when all characters following the * are the same. For example: (*BCD)</p> <p>beginning-of-keyword-value*end-of-keyword-value</p> <p>An intermediate asterisk indicates that a match for the value will be satisfied when all characters preceding and all characters following the asterisk are the same. For example: (ABC*EFG)</p> <p>keyword-value*</p> <p>An asterisk as the final character of a <i>keyword-value</i> indicates that a match will for the value will be satisfied when all characters preceding the asterisk are the same. For example: (ABC*)</p> <p>beginning-of-keyword-value*middle-of-keyword-value*end-of-keyword-value*</p> <p>Asterisks used as the first, intermediate and final characters in a string are also valid. For example: (*BCD*FGH*)</p> <p>For example, DISPLAY UTILITY (*) displays the status of all utilities; whereas, DISPLAY UTILITY (R2*) displays the status of all utilities whose identifiers begin with R2.</p> <p>The asterisk pattern-matching character is available to all Db2 commands, but not all Db2 commands support it. The asterisk can be used this way only in commands in which the pattern-matching operation is specifically supported.</p>
Underscore (_)	<p>Indicates that any character is a match a that position in a keyword value. For example, A_C matches any three-character keyword value with A as the first character and C as the third character.</p>
The two-character string NO	<p>Negates the keyword that follows. A negated keyword means the opposite of the keyword itself, and is often used to override a keyword default. In keywords that have no opposite meaning, the initial characters "NO" can be merely part of the keyword itself; for example, in NODE.</p>

Syntax rules for DSN subcommands

The syntax rules for DSN subcommands conform to standard TSO command parsing conventions. For general information about the syntax of TSO/E commands and subcommands, see [TSO/E commands and subcommands](#).

To continue a subcommand on the next line in the DSN processor, type either a hyphen (-) or a plus sign (+) at the end of the current line. If you use a plus sign, precede it by at least one blank character to prevent the concatenation of character strings from line to line. Using a plus sign causes TSO/E to delete leading delimiters (blanks, commas, tabs, and comments) on the continuation line, and reduces the overall size of the command.

Important: The names of the DSN command and its subcommands cannot be abbreviated. Abbreviations for some keywords are supported for compatibility with prior Db2 releases. However, avoid abbreviating keywords in the DSN command and its subcommand to avoid potential problems.

Data sharing scope of commands

In a data sharing environment, the *scope* of a command is the breadth of its impact among the members of the data sharing group. Many commands used in a data sharing environment have *member (or local) scope* because they affect only the Db2 subsystem for which they are issued. Other commands have *group scope* because they affect an object in such a way that affects all members of the group. For more information, see [Command scope \(Db2 Data Sharing Planning and Administration\)](#) or the "Environment" in the description of each command.

Output from commands

Several factors affect the amount of output you can receive from a Db2 command.

The amount of output that you receive from a Db2 command is always less than 256 KB. The following factors determine the maximum amount of output that is returned:

- The amount of storage available to your Db2 subsystem or to an individual command.
- The environment from which you issue the Db2 command.

For example, if you issue a Db2 command from an IMS console, you can receive no more than 32 KB of output.

- For DISPLAY DATABASE, the value of the LIMIT keyword. For more information, see [Chapter 22, “-DISPLAY DATABASE \(Db2\),”](#) on page 195.
- For DISPLAY THREAD, the number of lines of output. DISPLAY THREAD displays at most 254 lines of output. For more information, see [Chapter 36, “-DISPLAY THREAD \(Db2\),”](#) on page 265.

Recovery logs and commands

All Db2 commands issued after Db2 restart and before Db2 shutdown are logged by Db2. These commands are written in an IFCID 0090 trace record with a destination header that is mapped by macro DSNDQWIW. The log record type is 0010 (system event), and the subtype is 0041 (trace record).

Chapter 2. Command types and environments in Db2

Db2 supports several different types of commands that you can use to complete database administration tasks.

The commands are divided into the following categories:

The DSN command and subcommands

DSN is the Db2 command processor and executes as a TSO command processor.

All of the DSN subcommands, except SPUFI, run under DSN in either the foreground or background, and all, except END, also run under Db2 Interactive (DB2I). SPUFI runs only in the foreground under ISPF.

ABEND (DSN)

The DSN subcommand ABEND causes the DSN session to terminate with abend completion code X'04E' and reason code of X'00C50101'.

Important: The ABEND subcommand is used for diagnostic purposes only, and is intended to be used only under the direction of IBM Support. Use it only when diagnosing a problem with DSN or Db2.

BIND PACKAGE (DSN)

The DSN subcommand BIND PACKAGE builds an application package. Db2 records the description of the package in the catalog tables and saves the prepared package in the directory. BIND PACKAGE also deletes phased-out package copies.

BIND SERVICE (DSN)

The BIND SERVICE (DSN) subcommand builds an application package that represents a Db2 REST service.

BIND PLAN (DSN)

The DSN subcommand BIND PLAN builds an application plan. All Db2 programs require an application plan to allocate Db2 resources and support SQL requests made at run time.

BIND QUERY (DSN)

The DSN subcommand BIND QUERY reads the statement text, default schema, and a set of bind options from every row of DSN_USERQUERY_TABLE, and information from correlated EXPLAIN table rows. When LOOKUP(NO) is in effect, Db2 inserts the pertinent data into certain catalog tables.

DSN (TSO)

The TSO command DSN starts a DSN session.

END (DSN)

The DSN subcommand END is used to end the DSN session and return to TSO.

FREE PACKAGE (DSN)

The DSN subcommand FREE PACKAGE can be used to delete a specific version of a package, all versions of a package, or whole collections of packages.

FREE SERVICE (DSN)

The FREE SERVICE (DSN) subcommand deletes an application package that represents a Db2 REST service.

FREE PLAN (DSN)

The DSN subcommand FREE PLAN deletes application plans from Db2.

FREE QUERY (DSN)

The DSN subcommand FREE QUERY removes from certain catalog tables for one or more queries. If any of the specified queries are in the dynamic statement cache, FREE QUERY purges them from the dynamic statement cache.

[Chapter 42, “FREE STABILIZED DYNAMIC QUERY \(DSN\),” on page 331](#)

The DSN subcommand FREE STABILIZED DYNAMIC QUERY removes from certain catalog tables one or more stabilized dynamic queries. If any of the specified queries are in the dynamic statement cache, FREE STABILIZED DYNAMIC QUERY purges the statements from the dynamic statement cache.

[DCLGEN \(DECLARATIONS GENERATOR\) \(DSN\)](#)

The declarations generator (DCLGEN) produces an SQL DECLARE TABLE statement and a COBOL, PL/I, or C data declaration for a table or a view named in the catalog.

[REBIND PACKAGE \(DSN\)](#)

The DSN subcommand REBIND PACKAGE rebinds an application package when you make changes that affect the package, but have not changed the SQL statements in the program.

[REBIND PLAN \(DSN\)](#)

The DSN subcommand REBIND PLAN rebinds an application plan when you make changes to the attributes of the plan, such as the package list.

[REBIND TRIGGER PACKAGE \(DSN\)](#)

The DSN subcommand REBIND TRIGGER PACKAGE rebinds a package for a basic trigger. You can identify basic triggers by querying the SYSIBM.SYSTRIGGERS catalog table. Blank values in the SQLPL column identify basic triggers. For advanced triggers, use the REBIND PACKAGE command instead.

[RUN \(DSN\)](#)

The DSN subcommand RUN executes an application program, which can contain SQL statements.

[SPUFI \(DSN\)](#)

The DSN subcommand SPUFI executes the SQL processor using file input.

Db2 commands

You can use Db2 commands to control most of the operational environment.

START DB2 commands can be issued only from a z/OS console or TSO SDSF. All other Db2 commands can be issued from the following environments:

- z/OS consoles
- TSO terminals, by any of the following methods:
 - Issuing the DSN command from the TSO READY prompt
 - Entering commands in the **DB2 Commands** panel in DB2I
- IMS terminals
- Authorized CICS terminals

You can issue many commands from the background within batch programs, such as the following types of programs:

- z/OS application programs
- Authorized CICS programs
- IMS programs
- APF-authorized programs, such as a terminal monitor program (TMP)
- IFI application programs

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

For detailed descriptions of the Db2 commands, see the commands with names that are preceded by the recognition character "-" and identified by "(Db2)" in [Part 1, “About Db2 and related commands,” on page 1.](#)

The *extended MCS console feature* enables a z/OS system have more than 99 consoles. Because Db2 supports extended MCS consoles, messages returned from a Db2 command are routed to the extended MCS console that issued the command.

Message `DSN9022I` indicates the normal end of Db2 command processing; `DSN9023I` indicates the abnormal end of Db2 command processing.

IMS commands

You can use the following IMS commands to control IMS connections as well as to start and stop connections to Db2 and display activity on the connections. You can issue IMS commands from an IMS terminal or you can invoke IMS transactions or commands by using the Db2-supplied stored procedures `DSNAIMS` or `DSNAIMS2`. `DSNAIMS2` has the same functions as `DSNAIMS` but also provides multi-segment input support for IMS transactions.

For descriptions of the IMS commands, see [IMS commands](#).

/CHANGE (IMS) Resets an indoubt unit of recovery as identified by the OASN keyword of the `/DISPLAY` command. That command deletes the item from the standpoint of IMS, but it does not communicate to Db2. For example, issue the following command to reset all indoubt units of recovery for the subsystem named Db2:

```
/CHA SUBSYS DB2 RESET
```

Issue the following command to reset all indoubt units of recovery for all subsystems:

```
/CHA SUBSYS ALL RESET
```

Issue the following command to reset indoubt recovery units with OASN numbers 99, 685, and 2920 for subsystem Db2:

```
/CHA SUBSYS DB2 OASN 99 685 2920 RESET
```

/DISPLAY (IMS) Displays the status of the connection between IMS and an external subsystem (as well as all application programs communicating with the external subsystem), or the outstanding recovery units that are associated with the subsystem. For example, you can issue the following command to display the status of all connections with IMS:

```
/DISPLAY SUBSYS ALL
```

The result is similar to the following output:

SUBSYS SSTR	CRC ?	REGID	PROGRAM	LTERM	STATUS CONN
		1	DDLTL17	PTERM01	CONN, ACTIVE
		2	DDLTL06	PTERM02	CONN
85202/065933					

/SSR (IMS) Allows the IMS operator to enter an external subsystem command.

/START (IMS) Makes the connection between IMS and the specified external subsystem available. Establishing the connection allows application programs to access resources managed by the external subsystem.

/STOP (IMS) With the `SUBSYS` parameter, prevents application programs from accessing external subsystem resources.

/TRACE (IMS)

Directs and controls the IMS capabilities for tracing internal IMS events. It also starts, stops, and defines the activity to be monitored by the IMS Monitor. For example, the following command starts IMS trace, enables the Db2 trace, and writes IMS trace tables to the IMS log before they wrap:

```
/TRACE SET ON TABLE SUBS OPTION LOG
```

The following command starts IMS tracing, enables all trace tables (including Db2 trace tables); (ALL is the default parameter for the TABLE keyword), and writes IMS trace tables to the IMS log before they wrap.

```
/TRACE SET ON TABLE ALL OPTION LOG
```

CICS attachment facility commands

You can use CICS commands to control CICS connections as well as to start and stop connections to Db2 and display activity on the connections. Each CICS attachment facility command can be issued from a CICS terminal.

[Issuing commands to Db2 using the DSNB transaction \(CICS Transaction Server for z/OS\)](#)

[DSNB DISCONNECT \(CICS Transaction Server for z/OS\)](#)

[DSNB DISPLAY \(CICS Transaction Server for z/OS\)](#)

[DSNB STOP \(CICS Transaction Server for z/OS\)](#)

[DSNB STRT \(CICS Transaction Server for z/OS\)](#)

Administrative task scheduler commands

You can use administrative task scheduler commands to start, stop, and change the administrative task scheduler. All administrative task scheduler commands can be issued from a z/OS console.

[Chapter 47, “MODIFY admtproc,APPL=SHUTDOWN,” on page 345](#)

The MODIFY *admtproc*, APPL=SHUTDOWN command stops the administrative task scheduler from accepting requests and starting new task executions. It also shuts down the administrative task scheduler.

[Chapter 48, “MODIFY admtproc,APPL=TRACE,” on page 347](#)

The MODIFY *admtproc*, APPL=TRACE command starts or stops traces in the administrative task scheduler.

[Chapter 71, “START admtproc,” on page 429](#)

The START *admtproc* command starts the scheduler that is specified in the *admtproc* parameter

[Chapter 86, “STOP admtproc \(z/OS \),” on page 493](#)

The STOP *admtproc* command stops the administrative task scheduler that is specified in the *admtproc* parameter.

z/OS IRLM commands

You can use z/OS Internal Resource Lock Manager (IRLM) commands to start, stop, and change the IRLM. All z/OS IRLM command can be issued from a z/OS console.

[MODIFY irlmproc,ABEND \(z/OS IRLM\)](#)

The MODIFY *irlmproc* , ABEND command terminates IRLM abnormally. IRLM processes this command even if a Db2 subsystem is identified to it.

[MODIFY irlmproc,DIAG \(z/OS IRLM\)](#)

The MODIFY *irlmproc* , DIAG command initiates diagnostic dumps for IRLM subsystems.)

[MODIFY irlmproc,PURGE \(z/OS IRLM\)](#)

The MODIFY *irlmproc*,PURGE command releases IRLM locks retained due to a Db2, IRLM, or system failure.

[MODIFY irlmproc,SET \(z/OS IRLM\)](#)

The MODIFY irlmproc,SET command dynamically sets various IRLM operational parameters

[MODIFY irlmproc,STATUS \(z/OS IRLM\)](#)

The MODIFY irlmproc,STATUS command displays information for one or more subsystems connected to the IRLM that is specified using *irlmproc* .

TSO CLISTS

You can use Time Sharing Option (TSO) commands to perform TSO tasks such as prepare and execute programs under TSO.

Related tasks

[Controlling Db2 operations by using commands \(Db2 Administration Guide\)](#)

[Submitting work to Db2 \(Db2 Administration Guide\)](#)

Chapter 3. ABEND (DSN)

The DSN subcommand ABEND causes the DSN session to terminate with abend completion code X'04E' and reason code of X'00C50101'. It is intended to be used at the direction of IBM Support, if a problem is suspected (such as incorrect output) with another DSN subcommand, and the problem does not cause an abend and a dump to be generated.

Important: The ABEND subcommand is used for diagnostic purposes only, and is intended to be used only under the direction of IBM Support. Use it only when diagnosing a problem with DSN or Db2.

Environment

You can use ABEND from DB2I, or from a DSN session under TSO that runs in either the foreground or background.

Data sharing scope: Member.

Authorization

None is required.

Syntax

➤ ABEND ➤

Usage notes

Sometimes, the information dumped is not the information that you want. Always use the ABEND subcommand as soon as possible after a problem is re-created to increase the chances of obtaining meaningful data. Do not press the ATTENTION key before issuing the ABEND subcommand; usually, the data is lost.

Related tasks

Chapter 4. -ACCESS DATABASE (Db2)

The Db2 command ACCESS DATABASE forces a physical open of a table space, index space, or partition, or removes the GBP-dependent status for a table space, index space, or partition, or externalizes the real-time statistics and optimizer statistics recommendations from in-memory blocks to the appropriate catalog tables. The MODE keyword specifies the desired action.

Abbreviation: -ACC

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS® terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member or group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- STARTDB privilege
- DBMAINT authority
- DBCTRL authority
- DBADM authority
- SYSCTRL authority
- SYSADM authority
- System DBADM authority

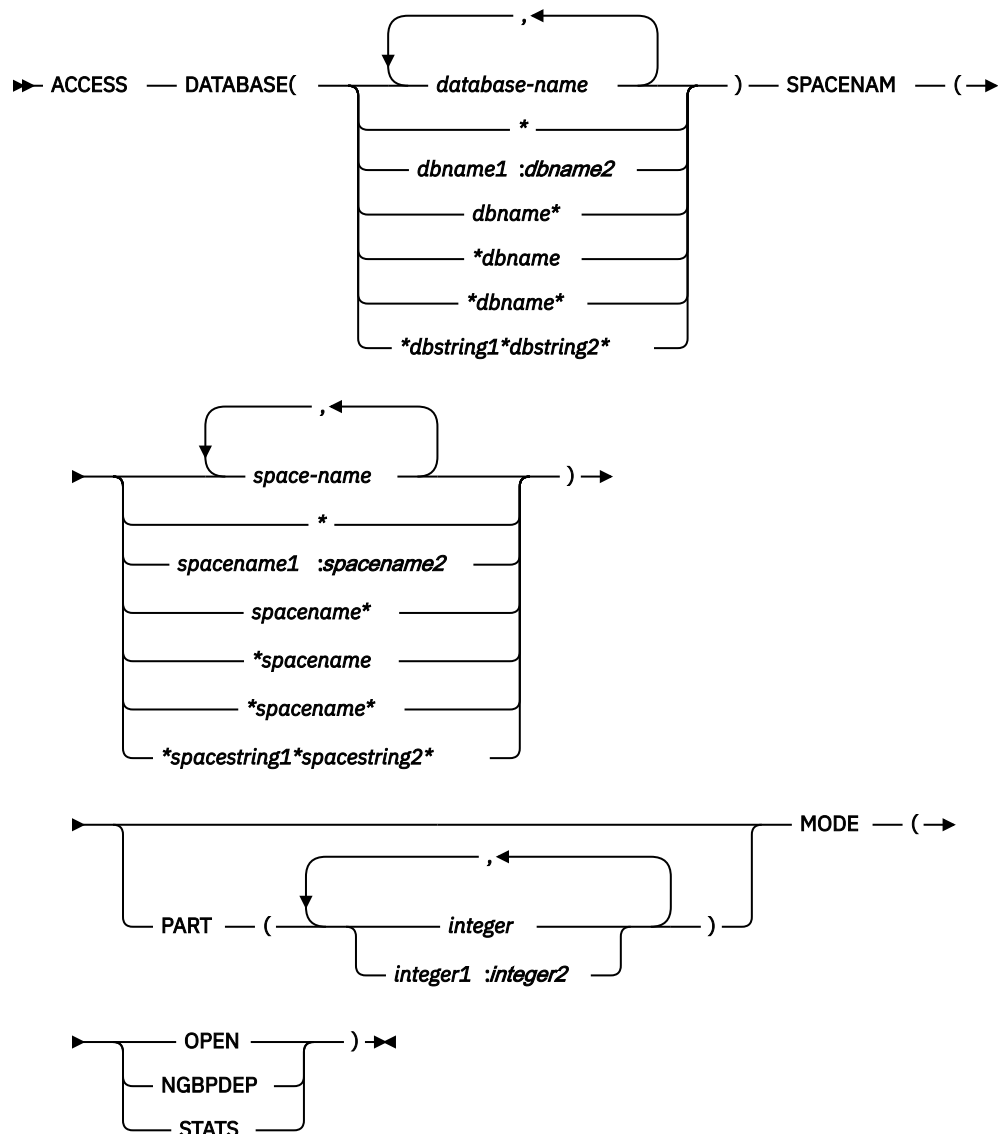

When you are using a privilege set that does not contain the STARTDB privilege for a specified database, Db2 issues an error message and the ACCESS command fails.

All specified databases with the STARTDB privilege included in the privilege set of the process are started.

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

When data definition control is active, installation SYSOPR or installation SYSADM authority is required to start a database, a table space, or an index space containing a registration table or index.

Syntax

Option descriptions

DATABASE (database-name,...)

Specifies the names of the database, or database for the table spaces or index spaces to access.

Abbreviation: DB

database-name

The name of one or more database to access. The following variations are accepted:

(database-name, ...)

Identifies one or more database names, separated by commas or blanks.

(*)

All databases that are defined to the Db2 subsystem for which the privilege set of the process has the required authorization.

(dbname1:dbname2)

All databases whose names, in UNICODE, are between *dbname1* and *dbname2* inclusive.

(dbname*)

All databases whose names begin with the string *dbname* that contains 1 - 7 characters.

(*dbname)

All databases whose names end with the string *dbname* that contains 1 - 7 characters.

(*dbname*)

All databases whose names contain the string *dbname*, where *dbname* that contains 1 - 6 characters.

(*dbstring1*dbstring2*)

All databases whose names contain the strings *dbstring1* and *dbstring2* that together contain a total of 2 - 5 characters.

SPACENAM(space-name, ...)

Indicates names of table spaces or indexes within the specified database to access.

Abbreviation: SPACE, SP

space-name

The name of one or more table spaces or index spaces to access. The following variations are accepted:

(spacename, ...)

One or more index space names, separated by commas or blanks.

(*)

All table spaces or index spaces that are defined to the Db2 subsystem for which the privilege set of the process has the required authorization.

(spacename1:spacename2)

All table spaces or index spaces whose names, in UNICODE, are between *spacename1* and *spacename2* inclusive

(spacename*)

All table spaces or index spaces whose names begin with the string *spacename* that contains 1 - 7 characters.

(*spacename)

All table spaces or index spaces whose names end with the string *spacename* that contains 1 - 7 characters.

(*spacename*)

All table spaces or index spaces whose names contain the string *spacename* that contains 1 - 6 characters.

(*spacestring1*spacestring2*)

All table spaces or index spaces whose names contain the strings *spacestring1* and *spacestring2* that together contain a total of 2 - 5 characters.

PART(integer,)

Indicates the partition number of one or more partitions, within the specified table space or index, that are to be accessed.

The specified *integer* value must identify a valid partition number for the corresponding space name and database name. If you specify nonvalid partition numbers, you receive an error message for each non-valid number, but all valid partitions that you specified are accessed.

integer can be written to designate one of the following specifications:

- A list of one or more partitions.
- A range of all partition numbers that collate greater than or equal to *integer-1* and less than or equal to *integer-2*.
- A combination of lists and ranges.

PART is valid with partitioned table spaces, partitioned indexes, and nonpartitioned type 2 indexes of partitioned table spaces. If you specify PART with a nonpartitioned table space or index on a nonpartitioned table space, you receive an error message, and the nonpartitioned space is not

accessed. When a logical partition is accessed, the index is not closed. A nonpartitioning index must be accessed without the use of PART to close the index.

MODE(*mode-value*)

Specifies the action for the command, where *mode-value* is one of the following values:

OPEN

Forces the physical opening of the page set or partition on just the local member. This moves the overhead of the physical open from an SQL thread to the command thread. This improves the transaction rate for the first SQL thread to reference a given page set or partition.

When MODE(OPEN) is specified, Db2 does not process objects with the following characteristics:

- The objects are defined with DEFINE NO.
- The physical data sets for the objects have not been created.

NGBPDEP

Removes group buffer pool dependency from the specified page set or partition. Use this before running large batch processes against a particular page set or partition to improve performance in a data sharing environment. Issue this command only on the same member that runs the batch processes. The page set or partition is drained when you specify this keyword.

STATS

Externalizes the in-memory real-time statistics and the optimizer recommendations to the appropriate catalog tables. In data sharing environments, the in-memory statistics are externalized for all members. This mode does not physically open the page sets or change the states of the page sets.

When the MODE (STATS) option is specified, only certain combinations of *database-name* and *space-name* values are recommended.

Usage notes

The following description contains additional information about how to use the ACCESS DATABASE command.

What to do if ACCESS DATABASE returns error message DSNIO45I

Issuing ACCESS DATABASE MODE(OPEN) on several members of a data sharing group at the same time might result in error message DSNIO45I and reason code 00C90090, due to resource contention. If this error occurs, reissue the ACCESS DATABASE MODE(OPEN) command to open all of the objects that the command affects. To avoid the error, do not issue ACCESS DATABASE MODE(OPEN) on multiple data sharing group members at the same time.

Examples

Example: Physically opening partitions

This command physically opens partitions 1 and 3 of table space DSN9002 of database DSN9001.

```
-ACCESS DATABASE(DSN9001) SPACENAM(DSN9002) PART(1,3) MODE(OPEN)
```

Example: Physically closing a nonpartitioned table space

This command physically closes the entire nonpartitioned table space DSN9003 of database DSN9001 and makes it non-group bufferpool dependent.

```
-ACCESS DATABASE(DSN9001) SPACENAM(DSN9003) MODE(NGBPDEP)
```

Output similar to the following output indicates that the command completed successfully:

```
-DSNTDDIS 'ACCESS DATABASE' NORMAL COMPLETION
```

Example: Externalize all in memory statistics to the real-time statistics tables

The following command externalizes all in-memory statistics and optimizer recommended statistics that are currently held in the system to the real-time statistics table.

```
-ACCESS DB(*) SP(*) MODE(STATS)
```

Chapter 5. -ACTIVATE (Db2)

The Db2 command ACTIVATE enables use of new capabilities and enhancements at the specified function level, and lower function levels. Use of the ACTIVATE command to activate function level 500 or higher also marks the boundary between the ability to coexist with or fallback to Db2 11.

Important: Before you activate function level 500 or higher for the first time, read [Activating Db2 12 new function at migration \(Db2 Installation and Migration\)](#).

On successful completion of the ACTIVATE command, the specified function level and all lower function levels become available for use. Use of the ACTIVATE command requires that the data sharing group contains no active Db2 11 members.

Important: Do not attempt to start Db2 at any code level that is lower than the highest ever activated function level, even at the lower star (*) function level. Activate a function level only after you are satisfied that Db2 can continue to run at the required code level.

Abbreviation: -ACTIVATE FUNCTION LEVEL(*function-level*)

Environment

The ACTIVATE command can be issued from a z/OS console, a DSN session under TSO, a Db2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Tip: You can tailor and run the DSNTIJAF job to issue the ACTIVATE commands. For more information, see [Activating Db2 12 function levels \(Db2 for z/OS What's New?\)](#).

Data sharing scope: Group

Authorization

To execute the ACTIVATE command, you must use a privilege set that includes the installation SYSADM or installation SYSOPR authority. The installation SYSOPR authority enables you to install or migrate Db2 without access to user objects.

►► ACTIVATE FUNCTION LEVEL — (— *function-level* —) — 

Option descriptions

function-level

The function level to activate in the subsystem or data sharing group. The format is *VvvRrMmm*, where *vv* is the version, *r* is the release, and *mmm* is the modification level. For example, V12R1M510 identifies function level 510. For a list of all available function levels in Db2 12, see [Db2 12 function levels \(Db2 for z/OS What's New?\)](#).

Activation of a function level succeeds only if the subsystem or every active member in the data sharing group runs at the required code level.

You can specify a higher or lower function level than the current function level. If a lower function level is specified, the star (*) function level is activated in the subsystem or data sharing group. For more information about activating star (*) function levels, see [Responding to problems after function level activation \(Db2 for z/OS What's New?\)](#).

A DSNU757I message indicates successful completion of the command, or the reason why the command was not successful.

TEST

The specified function level is not activated. Instead, the DSNU757I message output indicates the eligibility for the activation of the specified function-level of the subsystem or data sharing

group. The message output displays information about any member that prevents activation of the specified function level for the group. The message output displays code, catalog, and function level information for each subsystem or group member.

Important: When you check the readiness of your Db2 environment for a function level, be careful to specify the TEST option with the ACTIVATE command. After any successful completion of the ACTIVATE command without TEST, Db2 must remain at the higher code level. That is, you cannot remove any PTFs that the code level requires, even at a lower star (*) function level. You can also use the DISPLAY GROUP command to determine the highest function level that your Db2 environment supports, without risk of inadvertent function level activation. For more information and examples, see [Determining the Db2 code level, catalog level, and function level \(Db2 for z/OS What's New?\)](#).

Output

Message DSNU757I indicates successful completion of the command, or the reason why the command was not successful.

If a different function level is activated, Db2 also issues message DSNG014I to the console and updates the SYSLEVELUPDATES catalog table.

Examples

The following examples demonstrate use of the ACTIVATE command to test and activate Db2 12 function levels.

Example: Testing function level activation

GUIP The following command checks whether the subsystem or data sharing group is ready for the specified function level.

```
-ACTIVATE FUNCTION LEVEL (V12R1M500) TEST
```

The DSNU757I message indicates whether the group is ready for the specified level. Because TEST is specified, the output includes detailed information about each active member of the data sharing group. In this example, all of the members are at the required code level and catalog level so that function level 500 can be activated.

```
DSNU757I  -DB2A DSNUGCCA
*** BEGIN ACTIVATE FUNCTION LEVEL (V12R1M500)
          GROUP ELIGIBLE FOR FUNCTION LEVEL (V12R1M500)
          CATALOG LEVEL (V12R1M500)
          CURRENT FUNCTION LEVEL (V12R1M100)
          PREVIOUS HIGHEST FUNCTION LEVEL (V12R1M100)
          HIGHEST POSSIBLE FUNCTION LEVEL (V12R1M500)
```

DB2 MEMBER	ID	CURRENT CODE-LEVEL	CAPABLE FUNCTION LEVELS LOWEST	HIGHEST	STATUS
DB2A	1	V12R1M500	V12R1M100	V12R1M500	ELIGIBLE
DB2B	2	V12R1M500	V12R1M100	V12R1M500	ELIGIBLE
DB2C	3	V12R1M500	V12R1M100	V12R1M500	ELIGIBLE

```
DSN9022I  -DB2A DSNZACMD '-ACTIVATE FUNC' NORMAL COMPLETION
```

GUIP

Example: Activating function level 500

GUIP The following command attempts to activate function level 500.

```
-ACTIVATE FUNCTION LEVEL (V12R1M500)
```

The DSNU757I message indicates that function level 500 is successfully activated for the data sharing group.

```
DSNU757I  -DB2A DSNUGCCA
*** BEGIN ACTIVATE FUNCTION LEVEL (V12R1M500)
```

```

FUNCTION LEVEL (V12R1M500) SUCCESSFULLY ACTIVATED
CATALOG LEVEL(V12R1M500)
CURRENT FUNCTION LEVEL(V12R1M500)
PREVIOUS HIGHEST FUNCTION LEVEL (V12R1M500)

Usage notes

The availability of new function depends on the type of enhancement, the activated function level, and the application compatibility levels of applications. In the initial Db2 12 release, most new capabilities are enabled only after the activation of function level 500 or higher.

Virtual storage enhancements

Virtual storage enhancements become available at the activation of the function level that introduces them or higher. Activation of function level 100 introduces all virtual storage enhancements in the initial Db2 12 release. That is, activation of function level 500 introduces no virtual storage enhancements.

Subsystem parameters

New subsystem parameter settings are in effect only when the function level that introduced them or a higher function level is activated. Many subsystem parameter changes in the initial Db2 12 release take effect in function level 500. For more information about subsystem parameter changes in Db2 12, see [Subsystem parameter changes in Db2 12 \(Db2 for z/OS What's New?\)](#).

Optimization enhancements

Optimization enhancements become available after the activation of the function level that introduces them or higher, and full prepare of the SQL statements. When a full prepare occurs depends on the statement type:

- For static SQL statements, after bind or rebind of the package
- For non-stabilized dynamic SQL statements, immediately, unless the statement is in the dynamic statement cache
- For stabilized dynamic SQL statements, after invalidation, free, or changed application compatibility level

Activation of function level 100 introduces all optimization enhancements in the initial Db2 12 release. That is, function level 500 introduces no optimization enhancements.

SQL capabilities

New SQL capabilities become available after the activation of the function level that introduces them or higher, for applications that run at the equivalent application compatibility level or higher. New SQL capabilities in the initial Db2 12 release become available in function level 500 for applications that run at the equivalent application compatibility level or higher. You can continue to run SQL statements compatibly with lower function levels, or previous Db2 releases, including Db2 11 and DB2 10. For details, see [Application compatibility levels in Db2 \(Db2 Application programming and SQL\)](#)

Chapter 6. -ALTER BUFFERPOOL (Db2)

The Db2 command ALTER BUFFERPOOL alters attributes for active or inactive buffer pools. Altered values are used until altered again.

Abbreviation: -ALT BPOOL

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS, or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

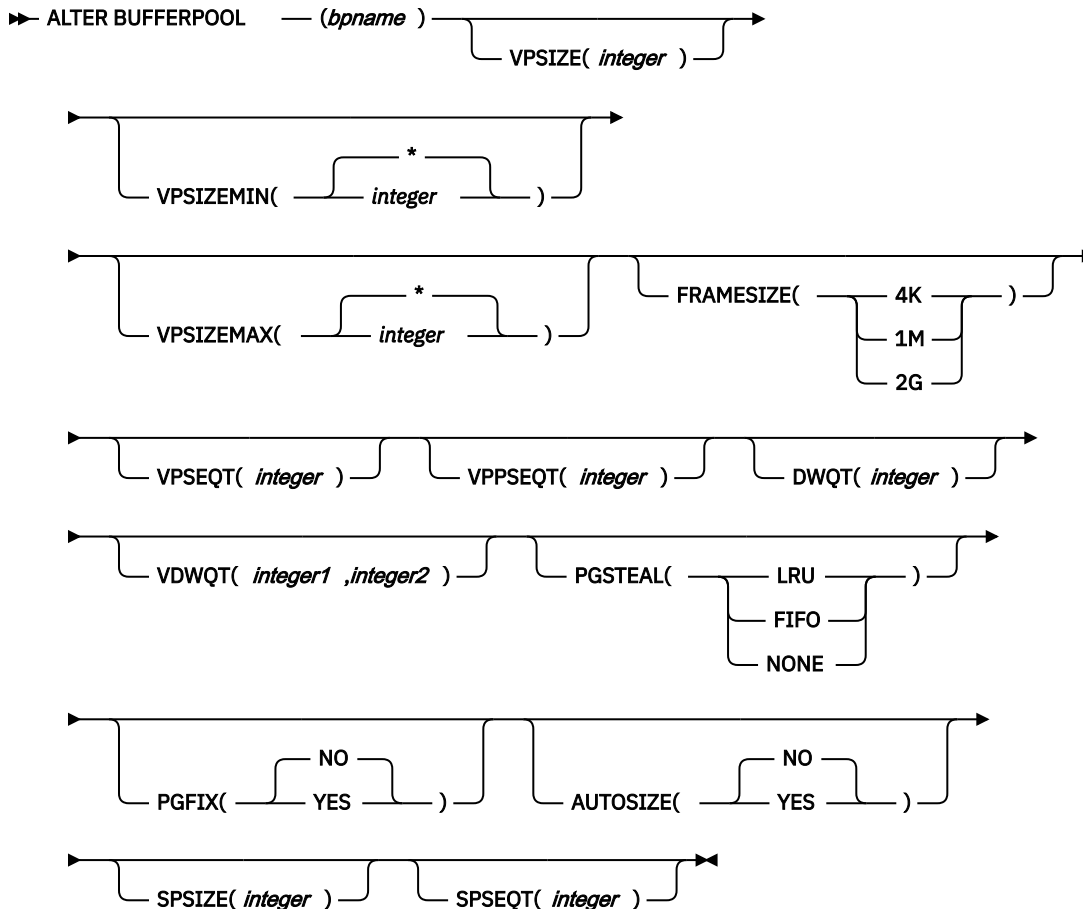

Authorization

To issue this command, you must use a set of privileges for the process that includes one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization that uses primary and secondary authorization IDs.

Syntax

Option descriptions

(bpname)

Specifies the buffer pool to alter.

- 4 KB page buffer pools are named BP0 through BP49
- 8 KB page buffer pools are named BP8K0 through BP8K9
- 16 KB page buffer pools are named BP16K0 through BP16K9
- 32 KB page buffer pools are named BP32K through BP32K9

VPSIZE (integer)

Changes the buffer pool size.

The value of *integer* specifies the number of buffers to allocate to the active buffer pool.

The value of *integer* can range 0 - 4000000000 for 4 KB page buffer pools other than BP0. For BP0, the minimum value is 2000. For 8 KB page buffer pools, the minimum value is 1000. For 16 KB page buffer pools, the minimum value is 500. For 32 KB page buffer pools, the minimum value is 250.

Db2 limits the sum of VPSIZE and SPSIZE for all buffer pools to 16 TB. In addition, Db2 limits the sum of buffer pool storage and simulated buffer pool storage to the smaller of the following values:

- Twice the available real storage in the z/OS system
- 16TB

When you set VPSIZE to 0 for an active buffer pool, the Db2 database manager quiesces all current database access and update activities for that buffer pool, and then deletes the buffer pool. Subsequent attempts to use table spaces or indexes that are assigned to that buffer pool fail. In addition, when you set VPSIZE to 0, and a simulated buffer pool is allocated, the database manager deletes the simulated buffer pool.

VPSIZEMIN (*integer*|*)

Sets the minimum size for the buffer pool. Possible values are:

Indicates that Db2 sets the minimum value to 75% of the current size. * is the default.

integer

Specifies the minimum number of buffers to allocate to the active buffer pool when AUTOSIZE(YES) is in effect. The following rules apply to *integer*:

- For buffer pools other than BP0, BP8K0, BP16K0, or BP32K, the value of *integer* for VPSIZEMIN must be less than or equal to the value of *integer* for VPSIZE. The value of VPSIZEMIN cannot be 0.
- For buffer pools BP0, BP8K0, BP16K0, or BP32K, valid ranges for *integer* are:

Buffer pool page size	Range for <i>integer</i>
4 KB	2000 - 4000000000
8 KB	1000 - 2000000000
16 KB	500 - 1000000000
32 KB	250 - 500000000

Abbreviation: VPMIN

VPSIZEMAX (*integer*|*)

Sets the maximum size for the buffer pool. Possible values are:

Indicates that Db2 sets the maximum value to 125% of the current size. Each time that the buffer pool is allocated or reallocated, if automatic buffer pool management is enabled and the buffer pool size increases, the maximum size of the buffer pool is 125% of the new, larger buffer pool size.

* is the default.

integer

Specifies the maximum number of buffers to allocate to the active buffer pool when AUTOSIZE(YES) is in effect. The following rules apply to *integer*:

- For buffer pools other than BP0, BP8K0, BP16K0, or BP32K, the value of *integer* for VPSIZEMAX must be greater than or equal to the value of *integer* for VPSIZE. The value of VPSIZEMAX cannot be 0.
- For buffer pools BP0, BP8K0, BP16K0, or BP32K, *integer* has the following range:

Buffer pool page size	Range for <i>integer</i>
4 KB	2000 - 4000000000
8 KB	1000 - 2000000000
16 KB	500 - 1000000000
32 KB	250 - 500000000

Abbreviation: VPMAX

FRAMESIZE(4K|1M|2G)

Sets the frame size for the buffer pool. Possible values are 2G, 1M, or 4K.

If you issue the ALTER BUFFERPOOL command with the FRAMESIZE option to modify the frame size for a buffer pool, the change is pending, and the buffer pool becomes fixed only at the next allocation.

If FRAMESIZE is 1M, and PGFIX is NO, Db2 uses 4 KB frames.

The frame size can be changed to 2 GB only if 2 GB of real memory is available. In addition, 2 GB of buffer storage must be available. If 2 GB frames cannot be allocated, Db2 allocates 1 MB frames.

PGSTEAL(NONE) and FRAMESIZE(2G) are not compatible in Db2 12. If you specify these options together, Db2 issues message DSNB549I and uses the PGSTEAL(LRU) algorithm until the next allocation of the buffer pool. However, PGSTEAL(NONE) is recorded in the BSDS. To use PGSTEAL(NONE), specify FRAMESIZE(1M) or FRAMESIZE(4K). For more information, see "Changed behavior for PGSTEAL(NONE) buffer pools" in [Storage release incompatibilities in Db2 12 \(Db2 for z/OS What's New?\)](#).

The following examples demonstrate the number of 2 GB frames that are allocated for various VPSIZE values and 4 KB buffer pools. This information is subject to change, and is intended only to give an approximate idea of the way that frames are allocated.

VPSIZE	Number of 2 GB frames allocated	Comment
100	0	The amount of storage that is available is less than 2 GB, and is less than the internally defined limit for rounding up to 2 GB.
498688	1	The amount of storage that is available is less than 2 GB, but is within an internally defined limit for rounding up to 2 GB.
524288	1	The amount of storage that is available is exactly 2 GB.
549888	1	The amount of storage that is available is greater than 2 GB, and less than an internally defined limit for rounding up to 4 GB.

Abbreviation: FRAME

VPSEQT (*integer*)

Changes the sequential steal threshold for the buffer pool.

This threshold is a percentage of the buffer pool that might be occupied by sequentially accessed pages. The pages can be in any state: updated, in-use, or available.

The getpage operations for a transaction are classified as sequential if the transaction attempts to prefetch the pages. The buffers that contain those pages are governed by VPSEQT, which makes them more likely to be stolen or demoted out of the buffer pool than buffers that are not governed by VPSEQT. A random buffer can never be reclassified as sequential, but a sequential buffer that is touched by a random getpage operation is classified as random.

The value of *integer* specifies the sequential steal threshold for the buffer pool. This value is expressed as a percentage of the total buffer pool size. The value of *integer* must be 0 - 100, inclusive. The default value is 80.

The sequential steal threshold:

- Prevents a sequential scan, a disorganized index scan, or certain other prefetch operations from overwhelming the buffer pool

- Helps reduce synchronous I/O by favoring random pages
- Affects the allocation of buffers and least-recently used (LRU) algorithms

If PGSTEAL(LRU) is specified for a buffer pool, and the number of sequential buffers in the pool is less than the VPSEQT value, Db2 steals the oldest buffer. When the number of sequential buffers in the pool is greater than the VPSEQT value, Db2 steals the oldest sequential buffer.

Buffers that are classified as sequential are stolen more quickly than buffers that are classified as random because VPSEQT limits the number of sequential buffers. Therefore, Db2 uses random buffers more than sequential buffers to reduce the frequency of synchronous I/O. As a result, Db2 might use more asynchronous prefetch I/O. Db2 classifies a buffer as sequential when a buffer is allocated for one of the following purposes:

- For use by Db2 prefetch
- For reading a LOB

Buffers for reading LOBs are classified as sequential because LOB pages are less likely to be referenced again than other types of pages.

- When a Db2 utility is writing a new Db2 data set sequentially

Db2 might also reclassify a sequential buffer as a random buffer if a random getpage operation touches a sequential buffer.

Setting VPSEQT to 0 disables prefetch. Any sequentially accessed pages are discarded when the number of available buffers is exceeded by the number of objects that are accessed. You can set VPSEQT to 0 to avoid unnecessary prefetch scheduling when the pages are already in the buffer pool, such as in the case of in-memory indexes or data. However, setting VPSEQT to 0 might disable parallelism. You can achieve the same result, and use fewer system resources, by specifying PGSTEAL(NONE).

To avoid accelerated LRU demotion, increase the value of VPSEQT to 99 or 100. You might need to increase the value if it is likely that prefetched pages are referenced more than one time, especially if the additional references are random getpage operations.

To encourage faster LRU demotion of the sequential pages, lower the VPSEQT value. However, if $VPSEQT \times VPSIZE$ is less than 160 MB, sequential I/O performance is reduced because a smaller value lowers the amount of sequential prefetch and I/O that is used by queries and utilities.

VPSEQT (integer)

Changes the parallel sequential threshold for the buffer pool. This threshold determines how much of the buffer pool is used for parallel processing operations.

The value of *integer* specifies the parallel sequential threshold for the buffer pool. This value is expressed as a percentage of the sequential steal threshold, and valid values range 0 - 100. The initial default value is 50.

When VPPSEQT=0, parallel processing operations and prefetch operations that are triggered by index I/O parallelism are disabled.

VPPSEQT (integer)

Sysplex query parallelism is no longer supported. Specifying this parameter has no effect.

DWQT (integer)

Changes the buffer pool's deferred write threshold.

The value of *integer* specifies the deferred write threshold for the buffer pool. This value is expressed as a percentage of the total buffer pool size, and valid values range 0 - 90. This threshold determines when deferred writes begin, based on the number of unavailable buffers. When the count of unavailable buffers exceeds the threshold, deferred writes begin. The initial default value is 30 percent.

VDWQT (integer-1,integer-2)

Changes the buffer pool's vertical deferred write threshold.

The value of *integer1* specifies the vertical deferred write threshold for the buffer pool. *integer1* is expressed as a percentage of the total buffer pool size, and valid values range 0 - 90.

This threshold determines when deferred writes begin, based on the number of updated pages for a particular data set. Deferred writes begin for that data set when the count of updated buffers for a data set exceeds the threshold. This threshold can be overridden for page sets accessed by Db2 utilities. It must be less than or equal to the value specified for the DWQT option.

The default value is 5 percent. A value of 0 indicates that the deferred write of 32 pages begins when the updated buffer count for the data set reaches 40.

The value of *integer-2* specifies the vertical deferred write threshold for the buffer pool. *integer-2* is expressed as an absolute number of buffers. You can use *integer2* when you want a relatively low threshold value for a large buffer pool, but *integer-1* cannot provide a fine enough granularity between *integer-1* values of 0 and 1. The value of *integer-2* applies only when the value of *integer-1* is 0. Db2 ignores a value that is specified for *integer-2* if the value specified for *integer-1* is non-zero. The value of *integer-2* can range 0 - 9999. The default value is 0.

If the value of *integer-1* is 0 and *integer-2* is a non-zero value, Db2 uses the value that is specified for *integer-2* to determine the threshold. If both values are 0, the *integer-1* value of 0 is used as the threshold.

PGSTEAL

Specifies the page-stealing algorithm that Db2 uses for the buffer pool.

The initial default is PGSTEAL(LRU).

(LRU)

Specifies that the buffer pool buffers are managed according to the rules of a least recently used (LRU) algorithm.

Simulated buffer pools can be used only when PGSTEAL is set to LRU.

(FIFO)

Specifies that the buffer pool buffers are managed according to the rules of a first-in-first-out (FIFO) algorithm. This option reduces the cost of maintaining the information about which buffers are least-recently used.

(NONE)

Specifies that no page stealing occurs if the buffer pool is large enough to contain all assigned open objects. Under this option, Db2 pre-loads the buffer pools when the objects are opened. Db2 implicitly creates an overflow area for pages that do not fit in the buffer pool. The overflow area is created when the buffer pool is allocated. The size of the overflow area is based on the VPSIZE value for the buffer pool. The overflow area is generally 10 percent of the VPSIZE value in the range of 50 - 6400 buffers. Db2 issues message DSNB604I message when the overflow area is used. Page stealing can occur in the overflow area, and Db2 uses the FIFO page-stealing algorithm when this occurs.

In a data sharing environment, after a page set or partition becomes non-GBP dependent and GBP dependent again, high levels of synchronous read I/O activity might occur. Resolving synchronous read I/O problems in data sharing environments (Db2 Data Sharing Planning and Administration) offers suggestions for how to resolve this performance problem. If VPSEQT=100, Db2 automatically does a prefetch of the object into the buffer pool, which can reduce the synchronous read I/O activity after these transitions occur.

PGFIX

Specifies whether the buffer pool is fixed in real storage when it is used.

(NO)

Specifies that the buffer pool is not fixed in real storage. Page buffers are fixed and unfixed in real storage across each I/O and group buffer pool operation.

This value is the default.

If PGFIX is set to NO, Db2 uses a 4 KB frame size.

(YES)

Specifies that the buffer pool is fixed in real storage.

If you use the ALTER BUFFERPOOL command with the PGFIX option set to YES to fix a buffer pool in real storage, the change is pending, and the buffer pool becomes fixed only at the next allocation.

AUTOSIZE

Specifies whether the buffer pool adjustment is turned on or off.

(NO)

Specifies that Db2 does not use Workload Manager (WLM) services for automatic buffer pool size adjustment.

This value is the default.

(YES)

Specifies that Db2 uses WLM services, if available, to automatically adjust the buffer pool size as appropriate.

For z/OS V2R1 or later, automatic buffer pool management increases or decreases the buffer pool sizes. For versions of z/OS below z/OS V2R1, automatic buffer pool management only increases the buffer pool sizes. If you use one of those versions of z/OS, you might need to manually reduce the size of a buffer pool that becomes too large.

When PGSTEAL(NONE) is used, AUTOSIZE(YES) is ignored. However, the AUTOSIZE attribute is saved. If the PGSTEAL attribute is later changed to something other than NONE, the AUTOSIZE(YES) attribute takes effect again when the buffer pool is reallocated with the new PGSTEAL attribute.

SPSIZE (integer)

Causes Db2 to simulate buffer pool behavior when the buffer pool size is increased by *integer*.

The value of *integer* specifies the number of buffers that are to be added to VPSIZE for the simulation. For example, if VPSIZE is currently 5000 buffers, set SPSIZE to 1000 to see what happens if you increase the buffer pool size by 20%.

Db2 limits the sum of VPSIZE and SPSIZE for all buffer pools to 16 TB. In addition, Db2 limits the sum of buffer pool storage and simulated buffer pool storage to the smaller of the following values:

- Twice the available real storage in the z/OS system
- 16TB

The minimum value of *integer* depends on the buffer pool page size. The maximum value of *integer* depends on the buffer pool page size and VPSIZE.

The following table shows the minimum and maximum values for SPSIZE:

Buffer pool page size (KB)	Minimum value for SPSIZE	Maximum value for SPSIZE
4	200	4000000000 - VPSIZE
8	100	2000000000 - VPSIZE
16	50	1000000000 - VPSIZE
32	25	500000000 - VPSIZE

If you specify SPSIZE(0) for a simulated buffer pool, Db2 quiesces all activity for the simulated buffer pool, and then deletes the simulated buffer pool. If a simulated buffer pool is active, and you specify a value for SPSIZE that is smaller than the current size but greater than 0, Db2 deletes the current simulated buffer pool and allocates a new simulated buffer pool with the smaller size.

SPSEQT (integer)

Changes the sequential steal threshold for the simulated buffer pool.

This threshold is the percentage of the total simulated buffer pool size that is used for sequentially accessed pages. In the simulated buffer pool, a simulated buffer is classified as sequential if the page was in a sequential buffer in the virtual buffer pool when the page was logically moved into the simulated buffer pool from the virtual buffer pool.

The value must be between 0 and 100. The initial default value is the value of VPSEQT, which is the sequential steal threshold for the virtual buffer pool. The initial default value is set when the SPSIZE is altered to a value greater than zero, if SPSEQT was never specified before.

When Db2 steals a buffer in the simulated buffer pool, if the percentage of sequential buffers to total buffers in the simulated buffer pool is greater than the SPSEQT value, Db2 steals the oldest sequential buffer. Otherwise, Db2 steals the oldest buffer.

Usage notes

The following description contains additional information about how to use the ALTER BUFFERPOOL command.

Changing several buffer pool attributes

A failure to modify one buffer pool attribute has no effect on other modifications that are requested in the same command.

Contracting an active buffer pool

If you use ALTER BUFFERPOOL to contract the size of an active buffer pool, Db2 contracts the pool by marking active buffers as "to be deleted," which means that they are not reusable to satisfy other page requests. However, the virtual storage might not be freed immediately. Determine the status of the buffer pool by issuing the DISPLAY BUFFERPOOL command.

Important: To avoid a major performance impact when you contract an active buffer pool, follow these guidelines:

- Do not lower the size of an active buffer pool by a large amount when there is a significant amount of buffer pool activity in the subsystem. Issue DISPLAY BUFFERPOOL to determine the amount of activity before you attempt to contract the buffer pool.
- If you need to do a very large buffer pool contraction, issue ALTER BUFFERPOOL several times to do multiple smaller contractions, instead of one large contraction.

Deleting an active buffer pool

If you use ALTER BUFFERPOOL to delete an active buffer pool (by specifying 0 for VPSIZE), Db2 issues a message to indicate that it is ready to explicitly delete this buffer pool. When Db2 accepts the delete buffer pool request, the buffer pool is marked as "delete pending". All current access to the buffer pool is quiesced, later access attempts fail with an error message, and all open page sets that refer to the buffer pool are closed.

Altering attributes that are stored in the BSDS

The buffer pool attributes that are stored in the BSDS cannot be changed offline.

Setting a buffer pool to be fixed in real storage

In order to fix the buffer pool in real storage, issue the command ALTER BUFFERPOOL (*bpname*) PGFIX(YES). If the buffer pool that you specify for *bpname* is not currently allocated, the buffer pool becomes fixed in real storage when it is allocated. If the buffer pool that you specify for *bpname* is currently allocated, do one of the following procedures to fix the buffer pool in real storage:

- If the buffer pool that you specify for *bpname* is not one of the buffer pools that is used for the Db2 catalog and directory (BP0, BP8K0, BP16K0, or BP32K):
 1. Issue the ALTER BUFFERPOOL command with the VPSIZE option set to 0 to deallocate the buffer pool:

```
-ALTER BUFFERPOOL (  
  bpname  
) VPSIZE(0)
```

2. Issue the ALTER BUFFERPOOL command with the VPSIZE and PGFIX options to change the buffer pool size and to use long-term page-fixing at the next allocation:

```
-ALTER BUFFERPOOL(  
  bpname  
) VPSIZE(  
  vpsize  
) PGFIX(YES)
```

- If the buffer pool that you specify for *bpname* is one of the buffer pools that is used for the Db2 catalog and directory (BP0, BP8K0, BP16K0, or BP32K):
 1. Issue the ALTER BUFFERPOOL command with the PGFIX option to change the buffer pool to use long-term page fixing (the change is pending until the next allocation of the buffer pool):

```
-ALTER BUFFERPOOL(  
  bpname  
) PGFIX(YES)
```

2. Issue the STOP DATABASE command or the STOP DB2 command to deallocate the buffer pool
3. Issue the START DATABASE command or the START DB2 command to reallocate the buffer pool (depending on which command you used to deallocate the buffer pool)

Requirements for simulated buffer pools

You can allocate simulated buffer pools to determine the best buffer pool sizes for your database system. When you issue ALTER BUFFERPOOL to create simulated buffer pools, the following conditions must be met:

- SPSIZE is greater than 0.
- The virtual buffer pool is allocated. This means that you set VPSIZE to a value greater than 0 when you previously issued ALTER BUFFERPOOL, or you set VPSIZE to a value greater than 0 when you issue ALTER BUFFERPOOL to create the simulated buffer pool.
- PGSTEAL must be LRU.

If the value of SPSIZE is greater than 0, and you set PGSTEAL to NONE or FIFO, the Db2 database manager sets SPSIZE to 0. If the simulated buffer pool is already allocated, the database manager deletes it. If the value of PGSTEAL is NONE or FIFO, and you issue ALTER BUFFERPOOL to set the SPSIZE value from 0 to a value greater than 0, the SPSIZE value is not changed.

Restriction on changing VPSIZE during buffer pool simulation

Do not set VPSIZE to 0 while you are doing buffer pool simulation. Setting VPSIZE to 0 deallocates real and simulated buffer pools, even if the SPSIZE value is greater than 0.

Prerequisite for FRAMESIZE(2G)

Before you can use 2 GB page frames, you must configure a 2 GB frame area after the initial program load (IPL) of z/OS. To do that, you need to specify parameter keywords in the LFArea keyword in the active IEASYSxx member of SYS1.PARMLIB to specify the amount of real storage that is to be used for 1 MB and 2 GB pages.

Examples

Example: Setting the buffer pool size

This command sets the size of buffer pool BP0 to 2000.

```
-ALTER BUFFERPOOL(BP0) VPSIZE(2000)
```

Example: Setting the minimum and maximum buffer pool size

This command sets the minimum size of buffer pool BP32K to 1500, and the maximum size of buffer pool BP32K to 2500.

```
-ALTER BUFFERPOOL(BP32K) VPSIZEMIN(1500) VPSIZEMAX(2500)
```

Example: Setting the sequential steal threshold of a buffer pool

This command sets the sequential steal threshold of buffer pool BP0 to 75% of the buffer pool size.

```
-ALTER BUFFERPOOL(BP0) VPSEQT(75)
```

Example: Deleting a buffer pool

This command deletes buffer pool BP1.

```
-ALTER BUFFERPOOL(BP1) VPSIZE(0)
```

Use this option carefully because specifying a 0 size for an active buffer pool causes Db2 to quiesce all current database access. All subsequent requests to open page sets fail.

Syntax

Option descriptions

(*gbpname*)

Specifies the Db2 group buffer pool to alter.

- 4-KB group buffer pools are named GBP0 through GBP49
- 8-KB group buffer pools are named GBP8K0 through GBP8K9
- 16-KB group buffer pools are named GBP16K0 through GBP16K9
- 32-KB group buffer pools are named GBP32K through GBP32K9

(structure-name)

Specifies the coupling facility structure for the group buffer pool. The coupling facility structure name has the format, *groupname_gbpname*.

groupname is the Db2 data sharing group name and the underscore (_) separates *groupname* and *gbpname*.

GBPCACHE

Specifies whether *gbpname* is to be used for both caching data and cross-invalidation, or just for cross-invalidation.

(YES)

Indicates that *gbpname* is used for caching data and cross-invalidation.

Any no-data-caching attribute that is specified at either the page set or group buffer pool level takes precedence over a caching specification. The following table illustrates the precedence of a no-data-caching specification.

Table 2. Precedence of a no-data-caching specification

Group buffer pool specification	Page set specification	Attribute that takes precedence
GBPCACHE(NO)	GBPCACHE CHANGED GBPCACHE ALL	GBPCACHE(NO)
GBPCACHE(YES)	GBPCACHE NONE	GBPCACHE NONE

(NO)

Indicates that *gbpname* is used only for cross-invalidation. This group buffer pool contains no data entries. The GBPCACHE option of table spaces or index spaces that use this group buffer pool is ignored.

AUTOREC

Specifies whether automatic recovery by Db2 takes place when a structure failure occurs or when the connectivity of all members of the group to the group buffer pool is lost.

(YES)

Enables Db2 to automatically recover page sets and partitions that have a status of group buffer pool RECOVER pending (GRECP) and that have pages on the logical page list.

(NO)

Disables automatic recovery. Issue a START DATABASE command to recover page sets and partitions that have a status of GRECP or that have pages on the logical page list.

RATIO (ratio)

Changes the ratio of the number of directory entries to the number of data pages in the group buffer pool; that is, how many directory entries exist for each data page.

ratio can be a decimal number from 1.0 to 1024, inclusive. Any digits after the first decimal place are ignored; for example, 5.67 is treated as 5.6. If *ratio* is greater than 25, any digits after the decimal point are ignored; for example, 25.98 is treated as 25. The default ratio is 10.

The actual number of directory entries and data pages that are allocated depends on the size of the coupling facility structure, which is specified in the coupling facility policy definitions (CFRM policy).

CLASST (class-threshold1,class-threshold2)

Changes the threshold at which data in the class castout queue is cast out to disk.

class-threshold1 is a percentage of the number of data entries and can be an integer between 0 and 90, inclusive. The default is 5.

For example, CLASST(10,0) starts class castout when the number of pages in that class equals 10% of the group buffer pool page capacity.

class-threshold2 is an absolute number of pages. You can use *class-threshold2* when you need a relatively low threshold value for a large group buffer pool but *class-threshold1* does not provide the necessary granularity between the *class-threshold1* values of 0 and 1. *class-threshold2* can be an integer between 0 and 32767, inclusive. The default is 0.

For example, CLASST(0,2500) starts class castout when the number of pages in that class reaches 2500.

The value of *class-threshold2* is used only when *class-threshold1* is 0. If the value of *class-threshold1* is non-zero, the value of *class-threshold2* is ignored. If both *class-threshold1* and *class-threshold2* are 0, the *class-threshold1* value of 0 is used.

GBPOOLT (integer)

Changes the threshold at which data in the group buffer pool is cast out to disk.

integer is expressed as a percentage of the number of data entries and can range 0 - 90. The default is 30.

For example, GBPOOLT(55) casts out data if the number of pages in the group buffer pool equals 55% of the group buffer pool page capacity.

GBPCHKPT (integer)

Changes the time interval, in minutes, between successive checkpoints of the group buffer pool.

integer can range from 1 to 999999. Unless a value is explicitly specified for the GBPCHKPT option, the default value is 4 minutes.

The more frequently checkpoints are taken, the less time it takes to recover the group buffer pool if the coupling facility fails.

Usage notes

Defaults: Issuing the ALTER GROUPBUFFERPOOL command does not change any option that is not explicitly specified; the default is to leave the value unchanged. The following table lists the default values for the options when the command is first issued for a group buffer pool or a structure.

Table 3. Default option values when ALTER GROUPBUFFERPOOL is first issued

Option	Value
GBPCACHE	YES
RATIO	5
CLASST	5,0
GBPOOLT	30 (%)
GBPCHKPT	4 (minutes)

When new values take effect: When you issue the ALTER GROUPBUFFERPOOL command, some option specifications become effective only at the next allocation of the group buffer pool. The following table lists each option, when the new value takes effect, and if the option is applicable for a group buffer pool that is specified as GBPCACHE(NO).

Table 4. Changing group buffer pool attributes

Keyword	New value takes effect	Applicable if GBPCACHE(NO)?
GBPCACHE	at next allocation	N/A
AUTOREC	immediately	No
RATIO	at next allocation ²	No ³
CLASST	immediately	No ³

Table 4. Changing group buffer pool attributes (continued)

Keyword	New value takes effect	Applicable if GBPCACHE(NO)?
GBPOOLT	immediately	No ³
GBPCHKPT	immediately	No ³

Note:

1. You can use the z/OS command SETXCF START,REBUILD to have the change take effect if the group buffer pool is not duplexed. If the group buffer pool is duplexed and you want to change to GBPCACHE(NO), first go back to simplex mode and rebuild. GBPCACHE(NO) is not allowed for duplexed group buffer pools.
2. You can use the z/OS command SETXCF START,REBUILD to have the change take effect if the group buffer pool is not duplexed. If the group buffer pool is duplexed, first go back to simplex mode and rebuild; then optionally go back to duplex mode. If a group buffer pool is duplexed, both instances of that duplexed group buffer pool use the same RATIO value.
3. Db2 issues message DSNB761 when you specify this option for a GBPCACHE(NO) group buffer pool. These settings only take effect after the GBPCACHE attribute has been changed to YES.

Examples

Example: Changing the ratio of directory entries to data pages

For group buffer pool 0, the following command changes the ratio of directory entries to data pages to one directory entry for every data page. The RATIO specification becomes effective at the next allocation of the group buffer pool.

```
-DB1G ALTER GROUPBUFFERPOOL (GBP0) RATIO(1)
```

Example: Changing the class castout threshold

For group buffer pool 3, change the class castout threshold to 10 %. The new value takes effect immediately. Because the group name is DSNCAT, the coupling facility structure name is DSNCAT_GBP3. Also, when a structure fails, the AUTOREC(YES) option enables Db2 to automatically recover the page sets and partitions that are in a GRECP status or that have pages on the logical page list.

```
-DB1G ALTER GROUPBUFFERPOOL (DSNCAT_GBP3) CLASST(10,0) AUTOREC(YES)
```

Example: Changing the class castout threshold and the group buffer pool castout threshold

For group buffer pool 2, the following command changes the class castout threshold to 10% and the group buffer pool castout threshold to 50%. The new values take effect immediately.

```
-DB1G ALTER GROUPBUFFERPOOL (GBP2) CLASST(10,0) GBPOOLT(50)
```

Example: Changing the group buffer pool checkpoint frequency

For group buffer pool 32K, the following command changes the GBP checkpoint frequency to five minutes. The new value takes effect immediately. In this example, with AUTOREC(NO) specified, Db2 does not start automatic recovery when a structure fails. You might choose this option if you want to determine what page sets or partitions are in a GRECP status or have pages on the logical page list before you enter the START DATABASE command to recover the data with the options you specify.

```
-DB1G ALTER GROUPBUFFERPOOL (GBP32K) GBPCHKPT(5) AUTOREC(NO)
```

Chapter 8. -ALTER UTILITY (Db2)

The Db2 command ALTER UTILITY changes the values of certain parameters of an execution of the REORG utility that uses SHRLEVEL REFERENCE or CHANGE and the REBUILD utility that uses SHRLEVEL CHANGE.

Specifically, this command changes the values of DEADLINE, MAXRO, LONGLOG, and DELAY.

REBUILD and REORG can be altered only from the Db2 subsystem on which ALTER UTILITY is running.

ALTER UTILITY applies to a single utility control statement. It has no effect on other utility control statements that are later in the same job step. If a LISTDEF control statement is being processed, ALTER UTILITY applies only to the subset of list items that are currently being processed.

Abbreviation: -ALT UTIL

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (DB2 COMMANDS), an IMS or a CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

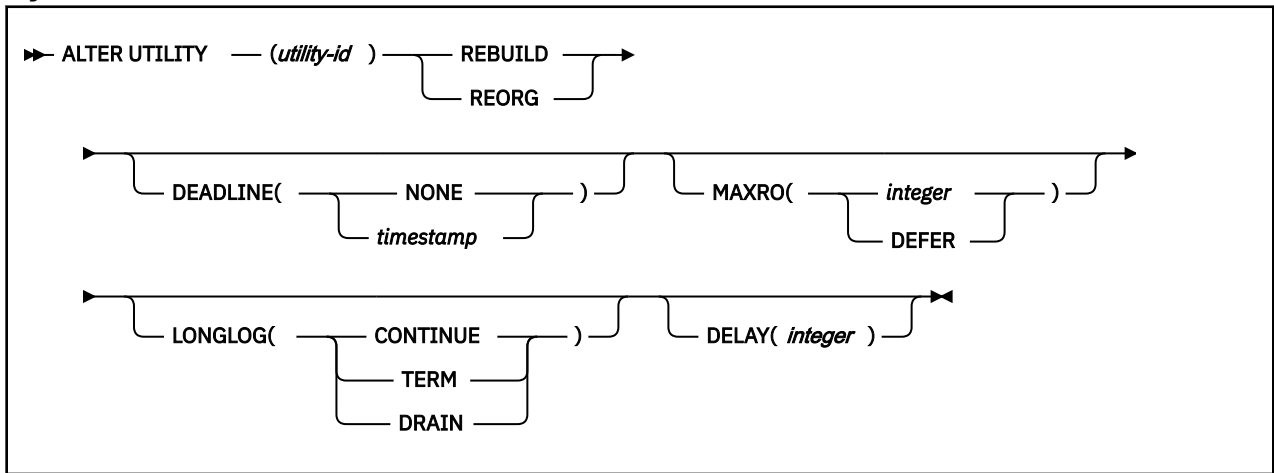

To execute this command, you must use the primary or some secondary authorization ID of the process that originally submitted the utility job. Alternatively, you must use a privilege set of the process that includes one of the following authorities:

- DATAACCESS authority
- DBCTRL authority
- DBADM authority
- System DBADM authority
- DATAACCESS authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

For users with DBMAINT, DBCTRL, or DBADM authority, the command takes effect only when a user has sufficient authority over each object that the utility job accesses.

Syntax

Option descriptions

(utility-id)

Is the utility identifier, or the UID parameter, used when creating the utility job step.

This job must execute REBUILD SHRLEVEL CHANGE, REORG with SHRLEVEL CHANGE, or SHRLEVEL REFERENCE.

If *utility-id* was created by the DSNU CLIST by default, it has the form *tso-userid.control-file-name*.

If *utility-id* was created by default by the EXEC statement that executed DSNUTILB, it has the form *userid.jobname*.

If *utility-id* contains lowercase letters or special characters, it must be enclosed in single quotation marks (').

REBUILD

Specifies that a REBUILD SHRLEVEL CHANGE utility is being altered.

REORG

Specifies that a REORG SHRLEVEL REFERENCE or REORG SHRLEVEL CHANGE utility is being altered.

DEADLINE

Specifies the deadline by which the user wants the switch phase of reorganization to start.

Only valid when altering a REORG SHRLEVEL REFERENCE or REORG SHRLEVEL CHANGE utility.

If Db2 estimates that the switch phase will not start by the deadline, Db2 terminates reorganization. The default is the value of DEADLINE that is currently in effect.

The pre-switch processing might continue until after the deadline.

(NONE)

Specifies that there is no deadline for the read-only iteration of log processing.

(timestamp)

Specifies the deadline by which the user wants the switch phase to start processing. This deadline must not have been reached when ALTER UTILITY executes.

MAXRO

Specifies the maximum amount of time that is tolerated for the last iteration of log processing during reorganization. During that iteration, applications have read-only access.

The actual execution time of the last iteration can exceed the value specified for MAXRO.

The default is the value of MAXRO that is currently in effect.

(*integer*)

Specifies the number of seconds.

(DEFER)

Specifies that the log phase is deferred indefinitely.

LONGLOG

Specifies the action that Db2 performs (after sending the LONGLOG message to the console) if the number of log records that are processed during the next iteration is not sufficiently lower than the number of log records that were processed during the previous iterations. The default is the value of LONGLOG that is currently in effect.

(CONTINUE)

Specifies that Db2 continues the log phase.

(TERM)

Specifies that Db2 terminates the utility after the delay.

(DRAIN)

Specifies that Db2 drain the write claim class after the delay (if specified). The number of log records, and thus the *estimated* time, for a future iteration of log processing will be 0.

DELAY (*integer*)

Specifies a lower bound for the interval between the time when the utility sends the LONGLOG message to the console and the time when the utility performs the action specified by the LONGLOG parameter.

integer is the delay in seconds. The value must be nonnegative. The default is the value of DELAY that is currently in effect.

Examples

Example: Alter several options for an execution of the REORG utility

The following commands alters the execution of the REORG utility for the utility job step whose utility identifier is REORGEMP:

```
-ALTER UTILITY (REORGEMP) REORG MAXRO(240) LONGLOG(DRAIN)
```

The following list explains what each option does in the preceding example:

- MAXRO(240) changes the maximum tolerable time for the last iteration of log processing to 240 seconds (4 minutes).
- LONGLOG(DRAIN) specifies that Db2 drain the write claim class (if reading of the log during REORG is not catching up to the speed at which the application is writing the log).
- DELAY is not specified so this example does not change the existing delay between sending the LONGLOG message to the console and performing the action specified by LONGLOG.
- DEADLINE is not specified so this example does not change the deadline (if any) that was defined in the last iteration of log processing.

Chapter 9. -ARCHIVE LOG (Db2)

The Db2 command ARCHIVE LOG enables a site to close a current active log and open the next available log data set.

When issued without any options, the Db2 command ARCHIVE LOG performs the following functions:

- Truncates the current active log data sets
- Starts an asynchronous task to offload the data sets
- Archives previous active log data sets not yet archived
- Returns control to the user (immediately)

In a data sharing environment, you can truncate and archive the logs for an individual member or for all members in the group.

When specified with the option MODE(QUIESCE), the ARCHIVE LOG command attempts to quiesce (suspend) all Db2 user update activity on the Db2 active log prior to the offload process. When a system-wide point of consistency is reached (that is, when all currently active update users have reached a commit point), the active log is immediately truncated, and the offload process is initiated. The resulting point of consistency is captured in the current active log before it is offloaded. In a data sharing environment, you can create a system-wide point of consistency only for the entire group.

Abbreviation: -ARC LOG

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

The ARCHIVE LOG command can also be issued from the z/OS subsystem interface (SSI) to enable automated scheduling systems and other programs to execute the command via supervisor call instruction (SVC) 34.

Data sharing scope: Group or member, depending on whether you specify MODE(QUIESCE), or on which SCOPE option you choose

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- ARCHIVE privilege
- Installation SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

MODE(QUIESCE)

Halts all new update activity by the Db2 subsystem for a specified period of time and attempts to bring all existing users to a point of consistency after a commit or rollback. When a point of consistency is reached and captured in the current active log data set, the current active log data set is truncated, and another log data set in the inventory becomes current. Offload processing then begins with the oldest active log data set and ends with the active log data set that was truncated.

In a data sharing environment, before archiving logs of any member, this option quiesces all active members of a data sharing group. MODE(QUIESCE) also ensures that each inactive member had successfully quiesced its update activity and resolved any indoubt units of recovery (URs) before the inactive subsystem completed normal termination. If any Db2 subsystem is in a failed state, fails during quiesce processing, or is stopped with outstanding URs, the ARCHIVE LOG command fails, and the remaining active members allow update activity to proceed.

If no indoubt URs exist on all quiesced members, active or inactive, the archive operation can continue for active members in the group. Thus, you can archive logs of a data sharing group normally without forcing all members to be active. The current logs of inactive members are truncated and offloaded after they start.

If a system-wide point of consistency cannot be reached during the quiesce period, which is a length of time you can specify, execution of the ARCHIVE LOG command fails and an error message is issued. In a data sharing environment, the maximum time period applies for the whole group, and if any Db2 subsystem cannot quiesce within the time allowed, the command fails.

If there is no update activity on Db2 data when the command ARCHIVE LOG MODE(QUIESCE) is issued, the active log is truncated and offloaded immediately.

TIME(nnn)

Specifies the maximum length of time, in seconds, in which the Db2 subsystem is allowed to attempt a full system quiesce.

If you do not specify a time, the **default** is the length of time specified in the field QUIESCE PERIOD of installation panel DSNTIPA.

nnn can range from 001 to 999 seconds. You must allocate an appropriate time period for the quiesce processing or the following events can occur:

- The quiesce processing can expire before a full quiesce is accomplished.
- An unnecessary Db2 lock contention can be imposed.
- A timeout can occur.

This option is valid only when used in conjunction with the option MODE(QUIESCE).

WAIT

Specifies whether the Db2 subsystem should wait until the quiesce processing has completed before returning control to the invoking console or program, or should return control when the quiesce processing begins.

This option is valid only when used in conjunction with the option MODE(QUIESCE).

(NO)

Specifies that control must be returned to the invoking program when the quiesce processing begins.

If WAIT(NO) is used, quiesce processing is asynchronous to the user; that is, you can issue additional Db2 commands after the ARCHIVE LOG command returns control to you.

(YES)

Specifies that the quiesce processing must complete before returning control to the invoking console or program.

If WAIT(YES) is used, quiesce processing is synchronous to the user; that is, additional Db2 commands can be issued, but they are not processed by the Db2 command processor until the ARCHIVE LOG command is complete.

SCOPE

Specifies whether the command applies to the entire data sharing group or to a single member only. The SCOPE option is valid only in a data sharing environment; the option is ignored in a non-data-sharing environment. SCOPE cannot be specified if MODE(QUIESCE) is specified; the two keywords are mutually exclusive.

(MEMBER)

Initiates offload processing only for the member from which the command is issued. User update activity is not suspended. If that member, or the entire group, is already archiving, the command fails. This is the default, except when MODE(QUIESCE) is specified.

(GROUP)

Initiates offload processing for every member of the Db2 group. User update activity is not suspended. If any member of the group, or the entire group, is already archiving, the command fails.

CANCEL OFFLOAD

Cancels any off loading currently in progress and restarts the offload process, beginning with the oldest active log data set that has not been off loaded and proceeding through all active log data sets that need off loading. Any suspended offload operations are restarted.

Usage notes

Remote site recovery: The ARCHIVE LOG command is very useful when performing a Db2 backup in preparation for a remote site recovery. For example, the command allows the Db2 subsystem to quiesce all users after a commit point, and capture the resulting point of consistency in the current active log *before* the archive is taken. Therefore, when the archive log is used with the most current image copy (during an offsite recovery), the number of data inconsistencies will be minimized.

Simultaneous executions: The ARCHIVE LOG command cannot be executed if another ARCHIVE LOG command is in progress. Instead, error message DSNJ318I is issued and the command fails. This is true in both data sharing and non-data-sharing environments. For example, in a data sharing environment, the command fails if the data sharing member, or group to which it belongs, is already archiving.

Available active log space: ARCHIVE LOG cannot be used when the current active log is the last available active log data set because of the following reasons:

- All available active log space would be used.
- The Db2 subsystem would halt processing until an offload is complete.

Executing ARCHIVE LOG while STOP DB2 is in progress: ARCHIVE LOG without the option MODE(QUIESCE) is permitted when STOP DB2 MODE(QUIESCE) is in progress. However, if an attempt

is made to execute the ARCHIVE LOG command when a STOP DB2 MODE(FORCE) is in progress, error message DSNJ315I is issued and the ARCHIVE LOG command is not processed.

ARCHIVE LOG with the option MODE(QUIESCE) is not allowed when a STOP DB2 MODE(FORCE) or STOP DB2 MODE(QUIESCE) is in progress. If an attempt is made to run the ARCHIVE LOG command under these circumstances, error message DSNJ315I or DSNJ316I is issued.

If the system was not fully quiesced (as determined by the number of users which could not be quiesced), error message DSNJ317I is issued and ARCHIVE LOG command processing is terminated. The current active log data set is not truncated and switched to the next available active log data set, and the archive log is not created.

Canceling log offloads: It is possible for the offload of an active log to be suspended when something goes wrong with the offload process, such as a problem with allocation or tape mounting. Issuing ARCHIVE LOG CANCEL OFFLOAD interrupts the offload process and restarts the offload. The command causes an abnormal termination of the offload task, which can result in a dump. Use ARCHIVE LOG CANCEL OFFLOAD only if the offload task is no longer functioning, or if you want to restart a previous offload attempt that failed.

Demand on Db2 resources: Using the option MODE(QUIESCE) during times of peak activity or during periods in which time is critical causes a significant disruption in the availability of Db2 for all users of Db2 resources.

Interaction with DISPLAY THREAD: The command DISPLAY THREAD issues message DSNV400I, indicating that an ARCHIVE LOG MODE(QUIESCE) command is active.

Quiescing members of a data sharing group: It is not possible to quiesce a single member of a data sharing group. When MODE(QUIESCE) is specified in a data sharing group, the entire group is quiesced.

Executing ARCHIVE LOG while logging is suspended: While logging is suspended by SET LOG SUSPEND, do not use ARCHIVE LOG unless CANCEL OFFLOAD is specified. If logging is suspended, issue SET LOG RESUME to resume logging before issuing ARCHIVE LOG.

Examples

Example: Truncating the current active log data sets and switching to the next available active log

The following command truncates the current active log data sets and initiate an asynchronous job to offload the truncated data sets. No quiesce processing occurs.

```
-ARCHIVE LOG
```

Example: Initiating the default quiesce period before truncating the active log data sets and switching to the next available active log

The following command initiates a quiesce period. If all Db2 update activity is stopped within this period, truncate the current active log data set and switch to the next available active log data set. Let the value in the field QUIESCE PERIOD of installation panel DSNTIPA determine the length of the quiesce period. The MODE(QUIESCE) processing is asynchronous.

```
-ARCHIVE LOG MODE(QUIESCE)
```

If the Db2 subsystem can successfully block all update activity before the quiesce period ends, it proceeds to the next processing step. If the quiesce time period is insufficient to successfully quiesce the Db2 subsystem, the active log data sets are not truncated and the archive does not occur.

Example: Initiating a quiesce period of a specified length before truncating the active log data sets and switching to the next available active log

The following command initiates a quiesce period. If all Db2 update activity is stopped within this period, truncate the current active log data set and switch to the next available active log data set. The maximum length of the quiesce processing period is seven minutes (420 seconds) and the processing is synchronous for the entire seven minutes.

```
-ARCHIVE LOG MODE(QUIESCE) WAIT(YES) TIME(420)
```

If the Db2 subsystem can successfully block all update activity before the quiesce period ends, it proceeds to the next processing step. If the quiesce time period is insufficient to successfully quiesce the Db2 subsystem, the active log data sets are not truncated and the archive does not occur.

Example: Quiescing all members of a data sharing group before truncating the active log data sets and switching to the next available active log

The following command initiates a quiesce period for all members of the data sharing group. If all Db2 update activity is stopped within this period, truncate the current active log data set and switch to the next available active log data set. Specify a quiesce time period of 10 minutes (600 seconds) to override the value in the field QUIESCE PERIOD of installation panel DSNTIPA for member DB1G. If the update activity has not quiesced after the 10 minute quiesce period, the command fails and new update activity is allowed to proceed.

```
-DB1G ARCHIVE LOG MODE(QUIESCE) TIME(600)
```

Example: Truncating the active log data sets and initiating and offload for a single member of a data sharing group

In a data sharing environment the following command truncates the active log data sets for group member DB2G and initiate an asynchronous job to offload the truncated data sets, without any quiesce processing. In this example, SCOPE(MEMBER) is used by default.

```
-DB2G ARCHIVE LOG
```

Example: Truncating the active log data sets and initiating and offload for all members of a data sharing group

The following command truncates the data sets for all members of the data sharing group and initiate an asynchronous job to offload the truncated data sets, without any quiesce processing.

```
-DB2G ARCHIVE LOG SCOPE(GROUP)
```

Chapter 10. BIND PACKAGE (DSN)

The DSN subcommand BIND PACKAGE builds an application package. Db2 records the description of the package in the catalog tables and saves the prepared package in the directory. BIND PACKAGE also deletes phased-out package copies.

Environment

You can use BIND PACKAGE from DB2I, or from a DSN session under TSO that runs in either the foreground or background.

Data sharing scope: Group

Authorization

The package owner must have authorization to execute **all** statements embedded in the package for BIND PACKAGE to build a package without producing error messages. (The SYSADM authority includes this authorization.)

For VALIDATE(BIND), Db2 verifies the authorization at bind time, with the exception of the LOCK TABLE statement, and some CREATE, ALTER, and DROP statements. For those SQL statements, Db2 verifies the authorization at run time.

For VALIDATE(RUN), Db2 verifies the authorization initially at bind time, but if the authorization check fails, Db2 rechecks it at run time.

The required authorization to add a new package or a new version of an existing package depends on the value of subsystem parameter BINDNV. The default value is BINDADD.

The package owner must be a role to execute BIND PACKAGE in a trusted context with role ownership. If performing a bind in a trusted context that has a role-as-object owner, then the owner of the package will be a role. If OWNER is specified, then it is assumed to be a role. If it is not specified, then the role of the binder becomes the owner.

To specify the option SQLERROR(CHECK), the binder must have the BIND, BINDAGENT, or EXPLAIN privilege.

To specify the option EXPLAIN(ONLY), the binder must have the EXPLAIN privilege.

The following table summarizes the required authorization to run BIND PACKAGE, depending on the bind options that you specify, and in the case of the ADD option, the value of installation panel field BIND NEW PACKAGE.

Table 5. Summary of privileges needed for BIND PACKAGE options

Bind option	Installation panel field BIND NEW PACKAGE (BINDNV subsystem parameter)	Authorization required to run BIND PACKAGE
ADD, using the default owner or primary authorization ID	BINDADD	<p>The primary authorization ID (default owner) or role must have one of the following to add a new package or new version of an existing package to a collection:</p> <ul style="list-style-type: none"> • The BINDADD system privilege and either the CREATE IN privilege or PACKADM authority on the collection or on all collections • SYSADM, SYSCTRL, or system DBADM authority
ADD, using the default owner or primary authorization ID	BIND	<p>The primary authorization ID (default owner) or role must have one of the following to add a new package or a new version of an existing package to a collection:</p> <ul style="list-style-type: none"> • The BINDADD system privilege and either the CREATE IN privilege or PACKADM authority on the collection or on all collections • SYSADM, SYSCTRL, or system DBADM authority • PACKADM authority on the collection or on all collections • The BIND package privilege (can only add a new version of an existing package)

Table 5. Summary of privileges needed for BIND PACKAGE options (continued)

Bind option	Installation panel field BIND NEW PACKAGE (BINDNV subsystem parameter)	Authorization required to run BIND PACKAGE
ADD, specifying an OWNER other than the primary authorization ID ^{“1”} on page 57	BINDADD	<p>If any of the authorization IDs or roles of the process has SYSADM authority, SYSCTRL authority, or system DBADM authority, OWNER <i>authorization-id</i> can be any value, when subsystem parameter SEPARATE_SECURITY is set to NO. If any of the authorization IDs has the BINDAGENT privilege granted from the owner, <i>authorization-id</i> can specify the grantor as OWNER. Otherwise, the OWNER <i>authorization-id</i> must be one of the primary or secondary authorization IDs of the binder.</p> <p>If you specify OWNER <i>authorization-id</i>, Db2 first checks the OWNER and then the binder for the necessary bind privilege.</p> <p>If the binder does not have SYSADM, SYSCTRL, or system DBADM authority, the authorization ID or role of the OWNER must have one of the following to add a new package or new version of an existing package to a collection:</p> <ul style="list-style-type: none"> • The BINDADD system privilege and either the CREATE IN privilege or PACKADM authority on the collection or on all collections • SYSADM, SYSCTRL, or system DBADM authority

Table 5. Summary of privileges needed for BIND PACKAGE options (continued)

Bind option	Installation panel field BIND NEW PACKAGE (BINDNV subsystem parameter)	Authorization required to run BIND PACKAGE
ADD, specifying an OWNER other than the primary authorization ID ¹ on page 57	BIND	<p>If any of the authorization IDs or roles of the process has SYSADM authority, SYSCTRL authority, or system DBADM authority, OWNER <i>authorization-id</i> can be any value, when subsystem parameter SEPARATE_SECURITY is set to NO. If any of the authorization IDs has the BINDAGENT privilege granted from the owner, <i>authorization-id</i> can specify the grantor as OWNER. Otherwise, the OWNER <i>authorization-id</i> must be one of the primary or secondary authorization IDs of the binder.</p> <p>If you specify OWNER <i>authorization-id</i>, Db2 first checks the OWNER and then the binder for the necessary bind privilege.</p> <p>If the binder does not have SYSADM, SYSCTRL, or system DBADM authority, the authorization ID or role of the OWNER must have one of the following to add a new package or new version of an existing package to a collection:</p> <ul style="list-style-type: none"> • The BINDADD system privilege and either the CREATE IN privilege or PACKADM authority on the collection or on all collections • SYSADM, SYSCTRL, or system DBADM authority • PACKADM authority on the collection or on all collections • The BIND package privilege (can only add a new version of an existing package)

Table 5. Summary of privileges needed for BIND PACKAGE options (continued)

Bind option	Installation panel field BIND NEW PACKAGE (BINDNV subsystem parameter)	Authorization required to run BIND PACKAGE
REPLACE, using the default owner or primary authorization ID	BINDADD or BIND	<p>Primary authorization ID or role must have one of the following:</p> <ul style="list-style-type: none"> • Ownership of the package • BIND privilege on the package. If the package does not exist, see the authorization that is required for "ADD, using the default owner or primary authorization ID." • PACKADM authority on the collection or on all collections • SYSADM, SYSCTRL, or system DBADM authority

Table 5. Summary of privileges needed for BIND PACKAGE options (continued)

Bind option	Installation panel field BIND NEW PACKAGE (BINDNV subsystem parameter)	Authorization required to run BIND PACKAGE
REPLACE, specifying an OWNER other than the primary authorization ID “1” on page 57	BINDADD or BIND	<p>If any of the authorization IDs or roles of the process has SYSADM authority, SYSCTRL authority, or system DBADM authority, OWNER <i>authorization-id</i> can be any value, when subsystem parameter SEPARATE_SECURITY is set to NO. If any of the authorization IDs has the BINDAGENT privilege granted from the owner, <i>authorization-id</i> can specify the grantor as OWNER. Option descriptions

For descriptions of the options shown in the syntax diagram, see [Chapter 14, “BIND and REBIND options for packages, plans, and services ,” on page 77.](#)

Examples

Example: Replacing a version of a package

The following command replaces version `APRIL_VERSION` of package `TEST.DSN8BC12` at local location `USIBMSTODB22` with another version of the package. The new version (or it could be the same) is in the DBRM `DSN8BC12`. If the DBRM contains no version ID, the version ID of the package defaults to the empty string. The package runs only from the TSO BATCH environment, and from the CICS environment if the connection ID is `CON1`. The name `PRODUCTN` qualifies all unqualified table, view, alias and index names.

```
BIND PACKAGE (USIBMSTODB22.TEST) -  
  MEMBER (DSN8BC12) -  
  ACTION (REPLACE) REPLVER (APRIL_VERSION) -
```

```
QUALIFIER (PRODUCTN) -  
ENABLE (BATCH, CICS) CICS (CON1)
```

Example: Binding the SPUFI package with ISOLATION(UR)

UR isolation acquires almost no locks. It is fast and causes little contention, but it reads uncommitted data. Do not use ISOLATION(UR) unless you are sure that your applications and end users can accept the logically inconsistent data that can occur, such as in the case of this example.

Assume that a supervisor routinely executes SQL statements using SPUFI to check the status of parts as they go through the assembly process and to update a table with the results of her inspection. She does not need to know the exact status of the parts; a small margin of error is acceptable.

The supervisor queries the status of the parts from a production table called ASSEMBLY-STATUS and makes the updates in a non-production table called REPORTS. She uses the SPUFI option AUTOCOMMIT NO and has the habit of leaving data on the screen while she performs other tasks.

If the supervisor executes a version of SPUFI that is bound with ISOLATION(UR), the query for the status of the parts executes without acquiring locks using UR isolation level and the update executes using CS isolation level. Thus, the query does not inadvertently hold locks in the production table, which interferes with the production jobs, and the supervisor has data good enough for her purposes.

The SPUFI application is bound as follows:

```
BIND PACKAGE(DSNESPUR) -  
  COPY(DSNESPCS.DSNESM68) -  
  ACTION(ADD) -  
  ISOLATION(UR)
```

Example: Binding a package for a native SQL procedure

The following command creates a native SQL procedure named CHICAGO.PRODUCTION.MYPROC from the current location procedure TEST.MYPROC.

Deprecated function: The DEPLOY bind option is deprecated. For best results, deploy compiled SQL functions and native SQL procedures to multiple environments by issuing the same CREATE or ALTER statements separately in each Db2 environment.

Both native SQL procedures have the same version ABC. The package for native SQL procedure CHICAGO.PRODUCTION.MYPROC.(ABC) has XYZ as QUALIFIER.

```
CREATE PROCEDURE TEST.MYPROC LANGUAGE SQL VERSION ABC ...  
  
BEGIN  
  ...  
END  
  
BIND PACKAGE(CHICAGO.PRODUCTION) DEPLOY(TEST.MYPROC) COPYVER(ABC)  
  ACTION(ADD) QUALIFIER(XYZ)
```

The following command then replaces the native SQL procedure CHICAGO.PRODUCTION.MYPROC version ABC, using the current location native SQL procedure TEST.MYPROC version ABC.

```
BIND PACKAGE(CHICAGO.PRODUCTION) DEPLOY(TEST.MYPROC) COPYVER(ABC)  
  ACTION(REPLACE) REPLVER(ABC)
```

Related tasks

[Binding application packages and plans \(Db2 Application programming and SQL\)](#)

Related reference

[BIND and REBIND options for packages, plans, and services](#)

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

[REBIND PACKAGE \(DSN\)](#)

The DSN subcommand REBIND PACKAGE rebinds an application package when you make changes that affect the package, but have not changed the SQL statements in the program.

[BIND PLAN \(DSN\)](#)

The DSN subcommand BIND PLAN builds an application plan. All Db2 programs require an application plan to allocate Db2 resources and support SQL requests made at run time.

BIND NEW PACKAGE field (BINDNV subsystem parameter) (Db2 Installation and Migration)

Chapter 11. BIND PLAN (DSN)

The DSN subcommand BIND PLAN builds an application plan. All Db2 programs require an application plan to allocate Db2 resources and support SQL requests made at run time.

Environment

You can use BIND PLAN through DB2I, or from a DSN session under TSO that runs in either the foreground or background.

Data sharing scope: Group

Authorization

The plan owner must have authorization to execute **all** SQL statements embedded in the plan for BIND PLAN to build a plan without producing error messages. This excludes statements included in DBRMs that are bound to packages included in the package list of the plan. The SYSADM authority includes this authorization.

For VALIDATE(BIND), Db2 verifies the authorization at bind time, with the exception of the LOCK TABLE statement, and some CREATE, ALTER, and DROP statements. For those SQL statements, Db2 verifies the authorization at run time.

For VALIDATE(RUN), Db2 verifies the authorization initially at bind time, but if the authorization check fails, Db2 rechecks it at run time.

The plan owner must be a role to execute BIND PLAN in a trusted context with role ownership.

The following table explains the authorization required to run BIND PLAN, depending on the options specified.

Table 6. Summary of privileges needed for BIND PLAN options	
Option	Authorization required to run BIND PLAN
ADD, using the default owner or primary authorization ID	Primary authorization ID (default owner) must have one of the following privileges: <ul style="list-style-type: none">• BINDADD privilege• SYSADM, SYSCTRL, or system DBADM authority
ADD, specifying an OWNER other than the primary authorization ID	If the binder does not have SYSADM or SYSCTRL or system DBADM authority, the authorization ID of the new OWNER must have one of the following privileges: <ul style="list-style-type: none">• BINDADD privilege• SYSADM, SYSCTRL, or system DBADM authority
REPLACE, using the default owner or primary authorization ID	Primary authorization ID of the process must have one of the following privileges: <ul style="list-style-type: none">• Ownership of the plan• BIND privilege on the plan. If the plan does not exist, the authorization is the same as for ADD, using the default owner or primary authorization ID.• SYSADM, SYSCTRL, or system DBADM authority

Table 6. Summary of privileges needed for BIND PLAN options (continued)

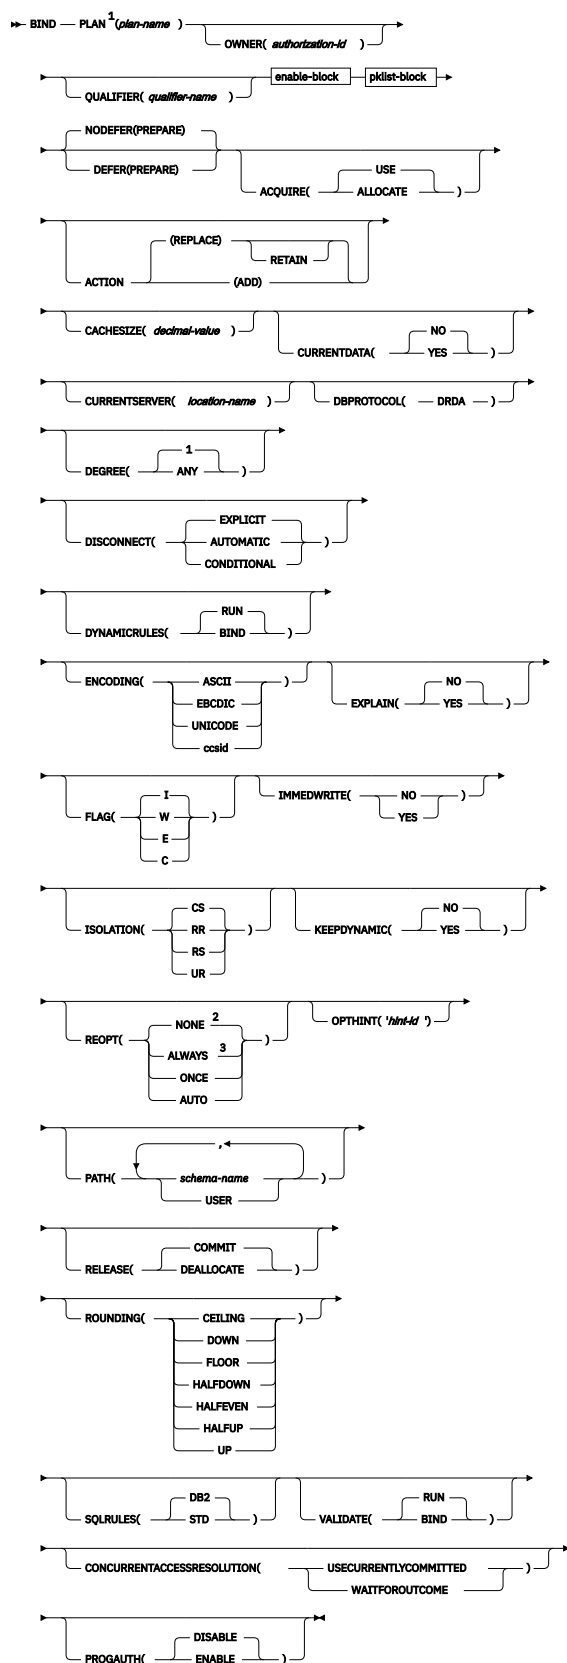

Option	Authorization required to run BIND PLAN
REPLACE, specifying an OWNER other than the primary authorization ID	<p>If the binder does not have SYSADM or SYSCTRL or system DBADM authority, the authorization ID of the OWNER must have one of the following privileges:</p> <ul style="list-style-type: none"> • Ownership of the plan • BIND privilege on the plan. If the plan does not exist, the authorization is the same as for ADD, specifying an OWNER other than the primary authorization ID. • BINDAGENT privilege from the current owner of the plan. • SYSADM, SYSCTRL, or system DBADM authority
PKLIST, specifying individual packages	<p>Authorization ID of the process must include one of the following privileges:</p> <ul style="list-style-type: none"> • EXECUTE authority on each package specified in the PKLIST • PACKADM authority on specific collections that contain the packages or on all collections • SYSADM or DATAACCESS authority
PKLIST, specifying (*), indicating all packages in the collection	<p>Authorization ID of the process must include one of the following privileges:</p> <ul style="list-style-type: none"> • EXECUTE authority on <i>collection-id</i> . * • PACKADM authority on specific collections that contain the packages or on all collections • SYSADM or DATAACCESS authority

Note: If any of the authorization IDs of the process has SYSADM, SYSCTRL, or system DBADM authority, OWNER *authorization-id* can be any value, when the system parameter, SEPARATE SECURITY, is set to NO. If any of the authorization IDs has the BINDAGENT privilege granted from the owner, then *authorization-id* can specify the grantor as OWNER. Otherwise, the OWNER *authorization-id* must be one of the primary or secondary authorization IDs of the binder.

Specifying the OWNER for ADD and REPLACE: If any of the authorization IDs of the process has SYSADM authority or SYSCTRL authority, OWNER *authorization-id* can be any value. If any of the authorization IDs has the BINDAGENT privilege granted from the owner, *authorization-id* can specify the grantor as OWNER. Otherwise, OWNER *authorization-id* must be one of the primary or secondary authorization IDs of the binder.

If you specify OWNER *authorization-id* , Db2 first checks the OWNER and then the binder for the necessary bind privilege. If both the OWNER and the binder do not have the necessary bind privilege and the IFCID 140 trace is active, the trace record is written.

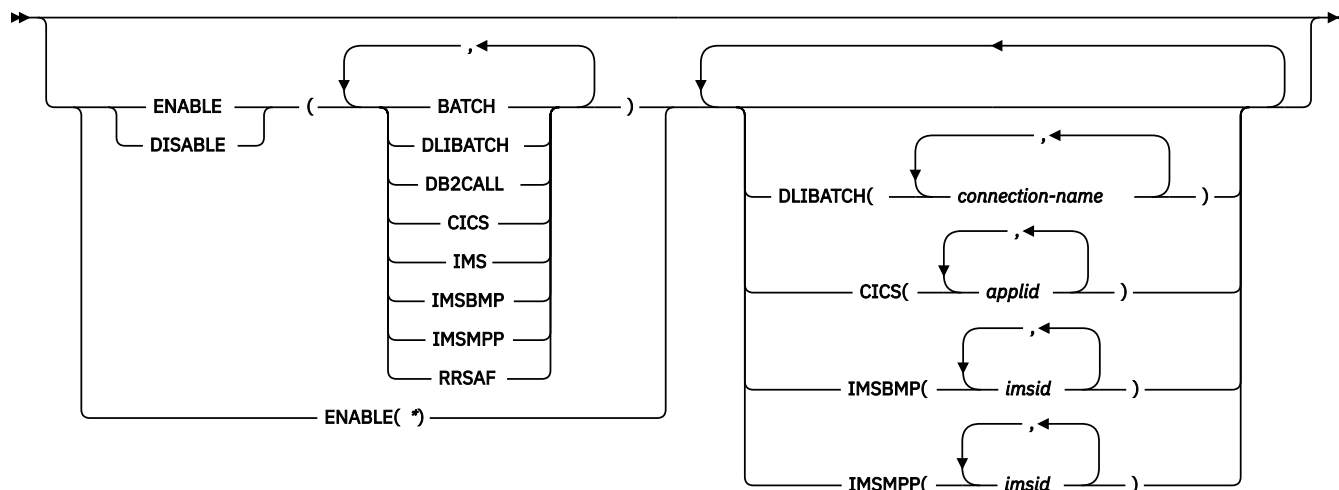

Syntax

Notes:

- ¹ If PLAN is not specified, all bind functions will be performed, including error diagnostics, without producing an application plan and without inserting rows into PLAN_TABLE for the option EXPLAIN.
- ² NOREOPT(VARS) can be specified as a synonym of REOPT(NONE)
- ³ REOPT(VARS) can be specified as a synonym of REOPT(ALWAYS)

enable-block

pklist-block

Option descriptions

For descriptions of the options shown in the syntax diagram, see [Chapter 14, “BIND and REBIND options for packages, plans, and services,”](#) on page 77.

Usage notes

The MEMBER option is deprecated

Although the BIND PLAN command accepts the MEMBER option, the MEMBER option is deprecated. Use it only when you cannot run BIND PACKAGE to bind DBRMs into packages explicitly. When you specify MEMBER, Db2 binds the DBRMs into packages, and binds the packages to the specified plan.

Examples

Example: Binding a plan with ISOLATION(CS) for maximum concurrency

This subcommand creates a new plan called IMSONLY. The SQL statements for the plan are in the package DSN8IC12.

An ISOLATION level of cursor stability (CS) provides maximum concurrency when you run the plan, and protects database values only while the program uses them. DEPTM92 owns the plan, but PRODUCTN qualifies any unqualified table, view, index, and alias names that are referenced in the package.

A cache size of 0 indicates that users will not run the plan repeatedly. Caching the names of users authorized to run the plan helps only when the same user runs the plan repeatedly while it is in the EDM pool. Because this is not the case with this plan, there is no need to reserve space in the EDM pool for a cache that the plan does not use.

The option `ENABLE(IMS)` runs the plan only from an IMS environment (DLI Batch, BMP and MPP). If you attempt to run the plan from another environment, such as TSO Batch, the plan allocation fails.

```

BIND PLAN(IMSONLY) -
  PKLIST(DSN8IC12.*) -
  ACTION(ADD) -
  ISOLATION(CS) -
  OWNER(DEPTM92) -
  QUALIFIER(PRODUCTN) -
  CACHESIZE -
  ENABLE(IMS)
```

Example: Binding a plan for a CICS environment only

The following subcommand creates a new plan called `CICSONLY`. The plan specifies an isolation level of cursor stability (CS). `DEPTM12` owns the plan, but `TESTSYS` qualifies any unqualified table, view, index, and alias names referenced in the package.

The option `ENABLE(CICS) CICS(CON1)` runs the plan only from CICS VTAM® node `CON1` which is specified in the `APPLID` parameter of the CICS SIT table. If you attempt to run the plan from another environment or from another CICS VTAM node, the run attempt fails. A cache size of 0 indicates that users will not run the plan repeatedly.

```

BIND PLAN(CICSONLY) -
  PKLIST(DSN8IC12.*) -
  ACTION(ADD) -
  ISOLATION(CS) -
  OWNER(DEPTM12) -
  QUALIFIER(TESTSYS) -
  CACHESIZE(0) -
  ENABLE(CICS) CICS(CON1)
```

[BIND and REBIND options for packages, plans, and services](#)

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both `BIND` and `REBIND` operations.

[BIND PACKAGE \(DSN\)](#)

The `DSN` subcommand `BIND PACKAGE` builds an application package. Db2 records the description of the package in the catalog tables and saves the prepared package in the directory. `BIND PACKAGE` also deletes phased-out package copies.

[REBIND PLAN \(DSN\)](#)

The `DSN` subcommand `REBIND PLAN` rebinds an application plan when you make changes to the attributes of the plan, such as the package list.

Chapter 12. BIND QUERY (DSN)

The DSN subcommand BIND QUERY reads the statement text, default schema, and a set of bind options from every row of DSN_USERQUERY_TABLE, and information from correlated EXPLAIN table rows. When LOOKUP(NO) is in effect, Db2 inserts the pertinent data into certain catalog tables.

The data inserted in the catalog tables creates one or more of the following methods for influencing access path selection for matching SQL statements:

- Overriding the selectivities of predicates.
- Specifying statement-level optimization parameters.
- Specifying statement level access paths.

Environment

You can use BIND QUERY from DB2I, or from a DSN session under TSO that runs in either the foreground or background. You can also use the SYSPROC.ADMIN_COMMAND_DSN to submit this subcommand from a remote requester.

The BIND QUERY command succeeds only when the value of the OPTHINTS susbsystem parameter is set to YES.

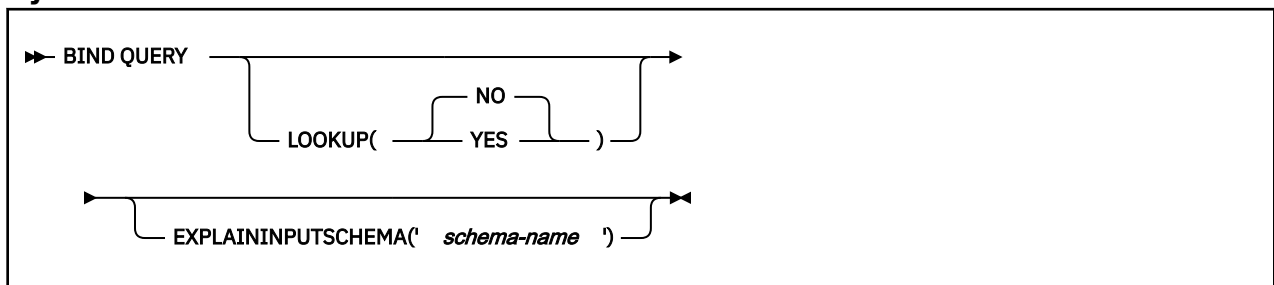

Data sharing scope: Group

Authorization

To issue this command, you must use a privilege set of the process that includes one of the following authorities:

- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Syntax

Option description

LOOKUP

Specifies whether to check catalog tables for existing rows that match rows in DSN_USERQUERY_TABLE. LOOKUP(NO) is the default value. When LOOKUP(YES) is in effect, rows are not inserted or modified in the catalog tables. When matching rows are found in the SYSIBM.SYSQUERY and SYSIBM.SYSQUERYPLAN catalog tables, Db2 inserts the value of the SYSQUERYPLAN.QUERYID column into the DSN_USERQUERY_TABLE.QUERYID column of the matching row.

(NO)

Db2 reads the information from the DSN_USERQUERY_TABLE and certain EXPLAIN tables and inserts the data into certain catalog tables to influence access path selection for matching statements. NO is the default value.

Depending on the values that are specified in DSN_USERQUERY_TABLE, rows might be read from the following additional input tables:

- *schema*.PLAN_TABLE
- *schema*.DSN_PREDICAT_TABLE
- *schema*.DSN_PREDICATE_SELECTIVITY

Where *schema* is value specified in the EXPLAININPUTSCHEMA option, or the authorization ID of the issuer of the BIND QUERY command.

Depending on the values that are specified in the input tables, data might be inserted in the following catalog tables:

- SYSIBM.SYSQUERY
- SYSIBM.SYSQUERYPLAN
- SYSIBM.SYSQUERYOPTS
- SYSIBM.SYSQUERYPREDICATE
- SYSIBM.SYSQUERYSEL

The catalog table rows influence access path selection for the following methods:

- Overriding the selectivities of predicates.
- Specifying statement-level optimization parameters.
- Specifying statement level access paths.

Db2 issues the following messages to indicate the results of BIND QUERY operation:

- A DSNT280I message for each DSN_USERQUERY_TABLE row that is inserted successfully into the catalog tables.
- A DSNT281I message for each DSN_USERQUERY_TABLE row that is not successfully inserted into the catalog tables.
- A single DSNT290I message if some rows were inserted into catalog tables successfully or a DSNT291I message if no rows were inserted successfully.

(YES)

Db2 reads information from the DSN_USERQUERY_TABLE and looks for the matching rows in the following catalog tables:

- SYSIBM.SYSQUERY
- SYSIBM.SYSQUERYPLAN
- SYSIBM.SYSQUERYOPTS

The catalog tables are not modified or populated with new values. When matching rows exist in the catalog tables, Db2 inserts the value of the SYSQUERY.QUERYID column into the DSN_USERQUERY_TABLE.QUERYID column of the matching row.

New rows are not inserted into the catalog tables when LOOKUP(YES) is specified. Instead, Db2 issues messages to indicate whether existing rows were identified:

- A DSNT280I message for each row in the DSN_USERQUERY_TABLE that has a valid matching row in the SYSIBM.SYSQUERY table.
- A DSNT281I message for each row in DSN_USERQUERY_TABLE that does not have valid matching rows in the SYSIBM.SYSQUERY.

- A single DSNT290I message if some matching rows were found or a DSNT291I message if no matches were found.

EXPLAININPUTSCHEMA

Specifies the schema name of the EXPLAIN tables that are to be used for input during BIND QUERY processing. The schema name must be enclosed in single quotation marks (').

EXPLAININPUTSCHEMA enables you to create separate EXPLAIN tables to be used only as input to the BIND QUERY command. By creating separate input tables, you can eliminate the need to remove unneeded rows that might interfere with BIND QUERY process from the EXPLAIN output tables. When the EXPLAININPUTSCHEMA option is not specified, Db2 uses the tables that are qualified by the authorization ID of the user that issues the BIND QUERY command.

Usage notes

Eligible SQL statements: BIND QUERY only processes the following types of the SQL statements.

- SELECT
- INSERT
- Searched UPDATE
- UPDATE WHERE CURRENT OF
- Searched DELETE
- DELETE WHERE CURRENT OF
- MERGE
- TRUNCATE

If you enter any SQL statement types other than those on the list above, Db2 issues a message.

DECP options: The following options must be the same when the BIND QUERY command is issued as when packages were bound, for static SQL statements, or when the statements were prepared, for dynamic SQL statements:

- CCSID
- Decimal point
- String delimiter

Cached dynamic SQL statements: During BIND QUERY time, after Db2 processes a query successfully, the query will be removed from the dynamic statement cache when the following conditions are met.

- The query is a dynamic SQL statement
- The access path to be specified exists in the PLAN_TABLE
- The query was prepared and saved in the dynamic statement cache before the BIND QUERY time and value of the OPTHINTS subsystem parameter is set to 'YES'

Examples

Example: Specifying statement-level optimization parameters

Suppose that you created an instance of DSN_USERQUERY_TABLE under your schema, and populated it with rows that specify optimization parameters. Use the following subcommand to create corresponding rows in the SYSIBM.SYSQUERY and SYSIBM.SYSQUERYOPTS catalog tables.

```
BIND QUERY
```

Chapter 13. BIND SERVICE (DSN)

The BIND SERVICE (DSN) subcommand builds an application package that represents a Db2 REST service. Db2 records the description of the service in the catalog tables and saves the prepared package in the directory.

Environment

You can issue BIND SERVICE from a DSN session under TSO that runs in the foreground or background.

Data sharing scope: Group

Authorization

The package owner must have the required authorization, such as the SYSADM authority, to execute the SQL statement embedded in a package and to build the package. If BIND SERVICE is issued in a trusted context defined with the ROLE AS OBJECT OWNER clause, the package owner must be a role with the role ownership to execute the command. If the OWNER option of the command is specified, the owner will be assumed a role. If the OWNER option is not specified, the role of the binder becomes the owner. If the trusted context is not specified with the ROLE AS OBJECT OWNER clause, the current rules for BIND ownership apply.

For VALIDATE(BIND), Db2 verifies the authorization at bind time. For VALIDATE(RUN), Db2 verifies the authorization initially at bind time, but if the authorization check fails, Db2 rechecks it at run time. The following table summarizes the authorization required for running BIND SERVICE, depending on the bind options that you specify and, in the case of the ACTION (ADD) option, the value of the BIND NEW PACKAGE field on installation panel DSNTIPP1:

Table 7. Required privileges for BIND SERVICE options

Bind option	Installation panel field BIND NEW PACKAGE (BINDNV subsystem parameter)	Authorization required to run BIND PACKAGE
ADD, using the default owner or primary authorization ID	BINDADD	The primary authorization ID (default owner) or role must have one of the following to add a new package to a collection: <ul style="list-style-type: none">• The BINDADD system privilege and either the CREATE IN privilege or PACKADM authority on the collection or on all collections• SYSADM, SYSCTRL, or system DBADM authority
ADD, using the default owner or primary authorization ID	BIND	The primary authorization ID (default owner) or role must have one of the following to add a new package to a collection: <ul style="list-style-type: none">• The BINDADD system privilege and either the CREATE IN privilege or PACKADM authority on the collection or on all collections• SYSADM, SYSCTRL, or system DBADM authority• PACKADM authority on the collection or on all collections• The BIND package privilege

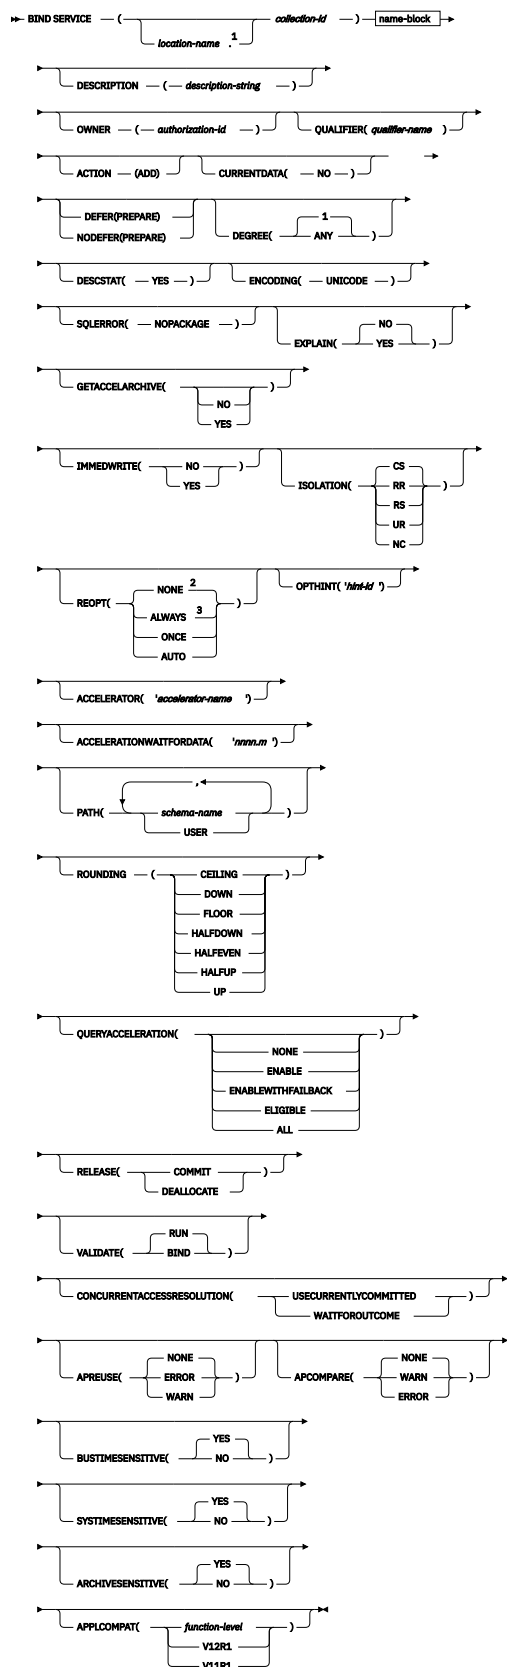

Table 7. Required privileges for BIND SERVICE options (continued)

Bind option	Installation panel field BIND NEW PACKAGE (BINDNV subsystem parameter)	Authorization required to run BIND PACKAGE
ADD, specifying an OWNER other than the primary authorization ID “1” on page 74	BINDADD	<p>If any of the authorization IDs or roles of the process has SYSADM authority, SYSCTRL authority, or system DBADM authority, OWNER <i>authorization-id</i> can be any value, when subsystem parameter SEPARATE_SECURITY is set to NO. If any of the authorization IDs has the BINDAGENT privilege granted from the owner, <i>authorization-id</i> can specify the grantor as OWNER. Otherwise, the OWNER <i>authorization-id</i> must be one of the primary or secondary authorization IDs of the binder.</p> <p>If you specify OWNER <i>authorization-id</i>, Db2 first checks the OWNER and then the binder for the necessary bind privilege.</p> <p>If the binder does not have SYSADM, SYSCTRL, or system DBADM authority, the authorization ID or role of the OWNER must have one of the following to add a new package to a collection:</p> <ul style="list-style-type: none"> • The BINDADD system privilege and either the CREATE IN privilege or PACKADM authority on the collection or on all collections • SYSADM, SYSCTRL, or system DBADM authority
ADD, specifying an OWNER other than the primary authorization ID “1” on page 74	BIND	<p>If any of the authorization IDs or roles of the process has SYSADM authority, SYSCTRL authority, or system DBADM authority, OWNER <i>authorization-id</i> can be any value, when subsystem parameter SEPARATE_SECURITY is set to NO. If any of the authorization IDs has the BINDAGENT privilege granted from the owner, <i>authorization-id</i> can specify the grantor as OWNER. Otherwise, the OWNER <i>authorization-id</i> must be one of the primary or secondary authorization IDs of the binder.</p> <p>If you specify OWNER <i>authorization-id</i>, Db2 first checks the OWNER and then the binder for the necessary bind privilege.</p> <p>If the binder does not have SYSADM, SYSCTRL, or system DBADM authority, the authorization ID or role of the OWNER must have one of the following to add a new package to a collection:</p> <ul style="list-style-type: none"> • The BINDADD system privilege and either the CREATE IN privilege or PACKADM authority on the collection or on all collections • SYSADM, SYSCTRL, or system DBADM authority • PACKADM authority on the collection or on all collections • The BIND package privilege

Note:

1. If both the OWNER and the binder do not have the necessary bind privilege and the IFCID 140 trace is active, a trace record is written with details about the authorization failure.

Syntax

[FREE SERVICE \(DSN\)](#)

The `FREE SERVICE (DSN)` subcommand deletes an application package that represents a Db2 REST service. The command also removes the corresponding entry from the catalog tables.

[BIND and REBIND options for packages, plans, and services](#)

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

Chapter 14. BIND and REBIND options for packages, plans, and services

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

Defaults: The *default* for an option is the value used if you omit the entire option.

A default of *plan value* for BIND PACKAGE means that the default is the same as the value determined during the bind or rebind of the plan to which the package is appended at run time.

A default of *existing value* for REBIND PLAN or REBIND PACKAGE means that the default is the value that was determined during the previous bind or rebind of the plan or package that you are rebinding.

Catalog records: The Db2 catalog records information about plans, packages, and services, mainly in the tables SYSIBM.SYSPLAN, SYSIBM.SYSPACKAGE, and SYSIBM.DSNSERVICE. The descriptions of where the options record information omit the constant qualifier, SYSIBM, of those table names.

For all other cases, the option descriptions note the specific defaults, which Db2 assigns at bind time. If a specific default value exists, that value is underlined.

ACCELERATOR bind option

The ACCELERATOR option sets the preferred target accelerator server or servers for accelerated static SQL queries and is the default value for the CURRENT ACCELERATOR special register used for dynamic SQL queries when the SET CURRENT ACCELERATOR statement is not issued.

ACCELERATOR	(<i>accelerator-name</i>)	On: BIND SERVICE, BIND PACKAGE, REBIND PACKAGE
-------------	-----------------------------	--

The bind option value affects runtime behavior only.

If a specified accelerator does not exist during bind time, a warning is issued.

If the specified preferred accelerator server is not enabled or available at runtime, Db2 will send the queries to other available accelerator servers.

Defaults:

Process	Default value
BIND SERVICE	None
BIND PACKAGE	None
REBIND PACKAGE	Existing value

ACCELERATIONWAITFORDATA bind option

The ACCELERATIONWAITFORDATA bind option specifies the maximum amount of time, if any, that an accelerator will delay a static SQL query while the accelerator waits for the replication of committed Db2

data changes that occurred prior to Db2 running the query. If the bind option is specified, it also provides the initial value for the CURRENT QUERY ACCELERATION WAITFORDATA special register that is used for dynamic queries, if a SET statement has not been issued for the special register.

ACCELERATIONWAITFORD *nnnn.m*
ATA

**On: BIND PACKAGE,
REBIND PACKAGE, BIND
SERVICE**

The delay wait time begins when the query reaches the accelerator, not when the query starts running in Db2. For more information about how to determine appropriate WAITFORDATA delay time values for query acceleration with replication in your environment, see the [WAITFORDATA information](#) in the IBM Db2 Analytics Accelerator for z/OS documentation.

The ACCELERATIONWAITFORDATA bind option applies to both static accelerated queries and dynamic accelerated queries in a Db2 package:

- For static accelerated queries in a Db2 package, this bind option is used when the QUERYACCELERATION bind option is also set to a valid value other than NONE to request that static queries be accelerated. If the QUERYACCELERATION bind option value is set to NONE, the ACCELERATIONWAITFORDATA bind option is accepted and the package is bound with the option value; however, the option will not apply to static SQL queries because no static queries will be accelerated.
- For dynamic accelerated queries in a Db2 package, if the ACCELERATIONWAITFORDATA bind option is specified, it also initializes the CURRENT QUERY ACCELERATION WAITFORDATA special register, which is used for dynamic queries if a SET statement hasn't been issued for that special register. Initializing CURRENT QUERY ACCELERATION WAITFORDATA to a value greater than 0 specifies that Db2 and the accelerator will apply WAITFORDATA delay behavior and restrictions to all dynamic queries to be accelerated from this Db2 package. The CURRENT QUERY ACCELERATION special register must also have a valid value other than NONE to request that dynamic queries be accelerated.

Important: When a non-zero value is specified for the ACCELERATIONWAITFORDATA bind option, Db2 and the accelerator will apply other WAITFORDATA delay behaviors, restrictions, and requirements to all queries that will be accelerated from the application package. These behaviors, restrictions, and requirements can cause queries that were formerly accelerated successfully to no longer be accelerated or to fail. See [SET CURRENT QUERY ACCELERATION WAITFORDATA \(Db2 SQL\)](#) for more information about WAITFORDATA behaviors, restrictions, and requirements.

nnnn.m

A DECIMAL(5,1) numeric-constant value that specifies the maximum number of seconds that the accelerator will delay a query while the accelerator waits for the replication of committed Db2 data changes that occurred prior to Db2 running the query.

You can specify a value in the range of 0.0 - 3600.0 seconds. For example, a value of 20.0 represents 20.0 seconds (or 20000 milliseconds), and a value of 30.5 represents 30.5 seconds (or 30500 milliseconds). The maximum value of 3600.0 means the query is delayed for 3600 seconds.

You can also specify the value as an INTEGER numeric-constant value ranging from 0 - 3600 seconds, which Db2 will convert to a DECIMAL(5,1) value.

Defaults:

Process	Default value
BIND PACKAGE	None
REBIND PACKAGE	None

Related reference

[CURRENT QUERY ACCELERATION WAITFORDATA special register](#)

ACQUIRE bind option

The ACQUIRE bind option specifies that resources for the packages in the plan are to be acquired when the application first accesses them.

ACQUIRE	(<u>USE</u>) (ALLOCATE) (deprecated)	On: BIND and REBIND PLAN
----------------	---	---------------------------------

This behavior is the default, regardless of whether you specify ACQUIRE(USE), ACQUIRE(ALLOCATE), which has been deprecated, or neither option.

The ACQUIRE option does not affect page, row, LOB or XML locks.

(USE)

Acquires table space locks only when the application program first uses them.

(ALLOCATE)

This option has no effect. ALLOCATE is deprecated. If you specify ACQUIRE(ALLOCATE) Db2 issues a warning and uses ACQUIRE(USE).

Defaults:

Process	Default value
BIND PLAN	USE
BIND PACKAGE	N/A
REBIND PLAN	USE
REBIND PACKAGE	N/A

There is no ACQUIRE option for packages. A package always acquires resources when it first uses them, as if you specified ACQUIRE(USE).

Catalog record: Column ACQUIRE of table SYSPLAN.

Related concepts

Bind options for locks ([Db2 Performance](#))

Related reference

[RELEASE bind option](#)

The RELEASE option determines when to release resources that a program uses, either at each commit point or when the program terminates.

ACTION bind option

The ACTION option determines whether the object (plan or package) replaces an existing object with the same name or is new.

ACTION	(<u>REPLACE</u>) (REPLACE) REPLVER (BIND PACKAGE only) (REPLACE) RETAIN (BIND PLAN only) (ADD)	On: BIND SERVICE (ADD), BIND PLAN, BIND PACKAGE
---------------	---	--

(REPLACE)

The object replaces an existing one with the same identifier, and a new entry replaces the old one in the catalog table SYSPLAN or SYSPACKAGE. If no object with the given identifier already exists, the bind process creates the new object and a new entry.

The authorization ID designated explicitly or implicitly by the option OWNER becomes the owner of the new object. If that authorization ID is not the previous owner, all grants of privileges for the object that the previous owner issued change to name the new owner as the grantor.

If the bind fails, the old object and its entry remain.

For BIND PACKAGE: You cannot use REPLACE with a remote package bound with either of the options ENABLE or DISABLE. The attempt causes the bind to fail.

REPLVER (*version-id*) (For BIND PACKAGE only)

Replaces a specific version of the package, identified by *version-id*. If the package with the specified *version-id* does not exist, the bind fails.

version-id is an undelimited identifier. Db2 does not convert the value to uppercase or change it in any other way.

The default for *version-id* comes from the DBRM if you use the MEMBER option on BIND, or from the COPYVER option if you use the COPY option.

RETAIN (For BIND PLAN only)

Preserves EXECUTE privileges when you replace the plan. If ownership of the plan changes, the new owner grants the privileges BIND and EXECUTE to the previous owner.

RETAIN is *not* the default. If you do not specify .RETAIN, everyone but the plan owner loses the EXECUTE privilege (but not the BIND privilege). If plan ownership changes, the new owner grants the BIND privilege to the previous owner.

(ADD)

Adds a new object, but does not replace an existing one. If the object name already exists in the catalog, the bind fails. If the bind fails for any reason, the bind process does not produce a new package or plan and makes no entry in the catalog.

Replacing a version of a package (REPLVER): ACTION(REPLACE) REPLVER can have different effects, depending on the situation. For example, assume that DBRM1 is the name of the member that contains the DBRM for the package, and that A and B are the names of two versions of the package. Suppose that you bind version A with the following command:

```
BIND PACKAGE(COLL1) MEMBER(DBRM1) ACTION(REPLACE) REPLVER(B)
```

- If neither DBRM1, version A, nor version B exist in the Db2 catalog, the command fails because version B is not in the catalog. No new package is added.
- If DBRM1 and version B, but not version A, exist in the Db2 catalog, then version A replaces version B. As a result, version A exists in the catalog, and version B no longer exists in the catalog.
- If DBRM1 and version A exist in the catalog, but not version B, the command fails because version B is not in the catalog. Version A continues to exist.
- If DBRM1 and both versions A and B exist in the catalog, the command fails because version A already exists.

Defaults:

Process	Default value
BIND SERVICE	ADD
BIND PLAN	REPLACE
BIND PACKAGE	REPLACE
REBIND PLAN	REPLACE
REBIND PACKAGE	N/A

Catalog record: Tables SYSPLAN or SYSPACKAGE.

APCOMPARE bind option

The APCOMPARE option determines whether the new access paths are different from the older access paths.

APCOMPARE	(<u>NO</u>) (<u>NONE</u>) (WARN) (ERROR)	On: BIND SERVICE, BIND PACKAGE, REBIND PACKAGE, REBIND TRIGGER PACKAGE
------------------	---	---

(NO)

Db2 does not compare access paths.

(NONE)

Db2 does not compare access paths.

([WARN])

Db2 compares the old and new access paths for each matching statement. If the access paths are structurally dissimilar, Db2 sends message DSNT285I and continues processing the package.

([ERROR])

Db2 compares the old and new access paths for each matching statement. If the access paths are structurally dissimilar, Db2 sends message DSNT285I and terminates package processing.

The APCOMPARE option is ignored for packages and package copies that were bound prior to DB2 9. You can identify the version on which a package or package copy was bound by checking the RELBOUND column in the SYSIBM.SYSPACKAGE or SYSIBM.SYSPACKCOPY catalog table.

Statements that reference temporal tables or archive tables: Db2 uses statement text as the matching criteria when it searches for older access paths in the prior package to evaluate. However, for static statements that reference temporal tables or archive tables, Db2 uses additional matching criteria. The reason is that statements that reference temporal tables or archive tables might be bound once or twice, depending on the value of the bind options SYSTIMESENSITIVE and ARCHIVESENSITIVE. In the following situations, the statement is bound twice:

- SYSTIMESENSITIVE is set to YES, and the statement references a system-period temporal table or bitemporal table.
- ARCHIVESENSITIVE is set to YES, and the statement references an archive table.

When the statement is bound twice, implicit predicates are added to the statement during the second bind. This process is called *implicit query transformation*. The type of implicit query transformation is identified in the EXPANSION_REASON column of PLAN_TABLE. Therefore, in addition to matching statement text, Db2 also checks that the access path in the prior package and in the current package have the same implicit predicate.

Defaults:

Process	Default value
BIND SERVICE	NONE
BIND PLAN	N/A
BIND PACKAGE	NONE
REBIND PLAN	NONE
REBIND PACKAGE	NONE

[ARCHIVESENSITIVE bind option](#)

The ARCHIVESENSITIVE option determines whether references to archive-enabled tables in both static and dynamic SQL statements are affected by the value of the SYSIBMADM.GET_ARCHIVE global variable.

[SYSTIMESENSITIVE bind option](#)

The SYSTIMESENSITIVE option specifies whether references to system-period temporal tables in both static and dynamic SQL statements are affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.

[PLAN_TABLE \(Db2 Performance\)](#)

APPLCOMPAT bind option

The APPLCOMPAT option specifies the application compatibility behavior for static SQL statements in the package. It also sets the initial value of CURRENT APPLICATION COMPATIBILITY special register, which controls the application compatibility behavior for dynamic SQL statements in the package. The value of the APPLCOMPAT subsystem parameter specifies the default value.

APPLCOMPAT	<i>(function-level)</i> (V11R1) (V10R1)	On: BIND SERVICE, BIND PACKAGE, REBIND PACKAGE, and REBIND TRIGGER PACKAGE
		Not valid for REBIND of a native SQL procedure package

The following values can be specified:

function-level

Specifies the application compatibility behavior of the *function-level* function level. The equivalent function level or higher must be activated.

The format is *VvvRrMmmm*, where *vv* is the version, *r* is the release, and *mmm* is the modification level. For example:

V12R1M510

Compatibility with the current highest available function level, function level 510.

V12R1M500

Compatibility with the function level that enables new function in the initial Db2 12 release, function level 500. V12R1M500 is the same as V12R1.

V12R1M100

Compatibility with the function level before you activate new function, after migration to Db2 12, function level 100. V12R1M100 has the same effect as V11R1.

For a list of supported *function-level* values, see [Db2 12 function levels \(Db2 for z/OS What's New?\)](#).

V10R1

Specifies Db2 10 compatibility behavior.

Defaults:

Process	Default value
BIND SERVICE	The value of the APPLCOMPAT subsystem parameter

Process	Default value
BIND PLAN	N/A
BIND PACKAGE	The value of the APPLCOMPAT subsystem parameter
REBIND PLAN	N/A
REBIND PACKAGE	Existing value. If there is no existing value, the APPLCOMPAT subsystem parameter is used.
REBIND TRIGGER PACKAGE	Existing value. If there is no existing value, the APPLCOMPAT subsystem parameter is used.

APRETAINDUP bind option

The APRETAINDUP option determines whether or not Db2 retains an old package copy when access paths of the old copy are identical to the incoming copy.

APRETAINDUP	(<u>YES</u>) (NO)	On: REBIND PACKAGE, and REBIND TRIGGER PACKAGE
--------------------	--------------------------	---

This option only applies when PLANMGMT(BASIC) or PLANMGMT(EXTENDED) are in effect.

(YES)

Db2 retains an old package copy

([NO])

Db2 does not retain an old package copy

Defaults:

Process	Default value
BIND PLAN	N/A
BIND PACKAGE	N/A
REBIND PLAN	N/A
REBIND PACKAGE	YES
REBIND TRIGGER PACKAGE	YES

Related reference

[PLANMGMT bind option](#)

The PLANMGMT option retains, during a rebind operation, all relevant package information (such as metadata, query text, dependencies, authorizations, and access paths) in catalog tables and in the directory.

APREUSE bind option

The APREUSE option specifies whether Db2 tries to reuse previous access paths for SQL statements in a package. Db2 uses information about the previous access paths from the directory to create a hint.

APREUSE	(<u>NONE</u>) (<u>NO</u>) (ERROR) (WARN)	On: BIND SERVICE, BIND PACKAGE, REBIND PACKAGE, and REBIND TRIGGER PACKAGE
----------------	---	---

The access path hint is not guaranteed to succeed in all cases. For example, a hint for an access path that relies on objects (such as indexes) that no longer exist cannot be reused. Version incompatibilities might also prevent access paths from being reused. Some access paths cannot be reused because of ambiguity in underlying hint. For example, a hint to use a merge join indicates the type of join to use and the number of matching columns, but the names of the matching columns are not available.

When APREUSE(ERROR) is specified for a BIND PACKAGE command, Db2 tries to locate the access path information from a package that has a matching identity based on the following criteria:

- Location
- Collection ID
- Name
- Version

If no such a package exists, Db2 tries to locate the most recently created version of a package that otherwise matches. When a prior version of a matching package is reused, Db2 issues a DSNT294I message. Even if a prior version exists, the set of static SQL statements in a previous version might not be identical to the set of statements in the new package. In such a situation, the APREUSE option only applies to statements that are identical in both versions.

Db2 issues a DSNT292I warning message when it cannot locate any previous package, and ignores the APREUSE option for that package.

Db2 reports the number of statements that were processed, the number of statements that reused the previous access path and the number of statements that could not reuse the previous access path in a DSNT286I message.

If package copies exist for a package, you can also specify the APREUSESOURCE option to specify the package copy to use for access path reuse.

(**NONE**)

Db2 does not try to reuse previous access paths for statements in the package.

(**NO**)

An accepted synonym for NONE.

(**[ERROR]**)

Db2 tries to reuse the previous access paths for SQL statements in the package. If statements in the package cannot reuse the previous access path, the bind operation for the package that contains the statement ends, and processing continues for the next package. Db2 indicates the number of statements that cannot be reused in any package in a message. New and changed statements in a package never prevent the completion of the bind or rebind operation, even though no previous access path is available for reuse.

(**[WARN]**)

Db2 tries to reuse the previous access paths for SQL statements in the package. Db2 ignores the previous access path and generates a new access path for any statement in the package that cannot

reuse the previous access. The bind operation for the package completes, regardless of whether some access paths cannot be reused. Db2 indicates the number of statements that cannot be reused in any package in a message.

The APREUSE option is ignored for package copies that were bound prior to DB2 9. The RELBOUND column in the SYSIBM.SYSPACKAGE or SYSIBM.SYSPACKCOPY catalog tables indicates the Db2 release on which a package or package copy was last bound or rebound.

Statements that reference temporal tables or archive tables: Db2 uses statement text as the matching criteria when it searches for older access paths in the prior package to reuse. However, for static statements that reference temporal tables or archive tables, Db2 uses additional matching criteria. The reason is that statements that reference temporal tables or archive tables might be bound once or twice, depending on the value of the bind options SYSTIMESENSITIVE and ARCHIVESENSITIVE. In the following situations, the statement is bound twice:

- SYSTIMESENSITIVE is set to YES, and the statement references a system-period temporal table or bitemporal table.
- ARCHIVESENSITIVE is set to YES, and the statement references an archive table.

When the statement is bound twice, implicit predicates are added to the statement during the second bind. This process is called *implicit query transformation*. The type of implicit query transformation is identified in the EXPANSION_REASON column of PLAN_TABLE. Therefore, in addition to matching statement text, Db2 also checks that the access path in the prior package and in the current package have the same implicit predicate.

Defaults:

Process	Default value
BIND SERVICE	NO
BIND PLAN	N/A
BIND PACKAGE	NO
REBIND PLAN	N/A
REBIND PACKAGE	NO
REBIND TRIGGER PACKAGE	NO
Automatic rebind	WARN

ARCHIVESENSITIVE bind option

The ARCHIVESENSITIVE option determines whether references to archive-enabled tables in both static and dynamic SQL statements are affected by the value of the SYSIBMADM.GET_ARCHIVE global variable.

ARCHIVESENSITIVE	(<u>YES</u>) (NO)	On: BIND SERVICE, BIND PACKAGE, REBIND PACKAGE, REBIND TRIGGER PACKAGE
		Not valid for REBIND of a package for a native SQL procedure, compiled SQL function, or advanced trigger

(YES)

References to archive-enabled tables are affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable.

(NO)

References to archive-enabled tables are not affected by the value of the SYSIBMADM.GET_ARCHIVE built-in global variable.

Interactions with the PLANMGMT option: If you plan to change this option and the PLANMGMT option in a REBIND command, see [“PLANMGMT bind option” on page 127](#) for the implications.

Defaults:

Process	Default value
BIND SERVICE	YES
BIND PLAN	N/A
BIND PACKAGE	YES
REBIND PLAN	N/A
REBIND PACKAGE	Existing value
REBIND TRIGGER PACKAGE	Existing value

[GET_ARCHIVE \(Db2 SQL\)](#)

BUSTIMESENSITIVE bind option

The BUSTIMESENSITIVE option determines whether references to application-period temporal tables in both static and dynamic SQL statements are affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register.

BUSTIMESENSITIVE	(YES) (NO)	On: BIND SERVICE, BIND PACKAGE, REBIND PACKAGE, REBIND TRIGGER PACKAGE Not valid for REBIND of a package for a native SQL procedure, compiled SQL function, or advanced trigger
-------------------------	-------------------	---

(YES)

References to application-period temporal tables are affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register.

(NO)

References to application-period temporal tables are not affected by the value of the CURRENT TEMPORAL BUSINESS_TIME special register

Interactions with the PLANMGMT option: If you plan to change this option and the PLANMGMT option in a REBIND command, see [“PLANMGMT bind option” on page 127](#) for the implications.

Defaults:

Process	Default value
BIND SERVICE	YES
BIND PLAN	N/A
BIND PACKAGE	YES
REBIND PLAN	N/A
REBIND PACKAGE	Existing value
REBIND TRIGGER PACKAGE	Existing value

Related reference

[CURRENT TEMPORAL BUSINESS_TIME \(Db2 SQL\)](#)

CACHESIZE bind option

The CACHESIZE option determines the size (in bytes) of the authorization cache acquired in the EDM pool for the plan.

CACHESIZE	(<i>decimal-value</i>)	On: BIND and REBIND PLAN
-----------	--------------------------	--------------------------

At run time, the authorization cache stores user IDs authorized to run. Consulting the cache can avoid a catalog lookup for checking authorization to run the plan.

decimal-value

The size of the cache can range 0 - 4096. Nonzero values that are not multiples of 256 round to the next highest multiple of 256. CACHESIZE(0) specifies creating no cache when the plan runs.

Defaults:

Process	Default value
BIND PLAN	Value of AUTHCACH subsystem parameter
BIND PACKAGE	N/A
REBIND PLAN	Existing value
REBIND PACKAGE	N/A

Catalog record: Column CACHESIZE of table SYSPLAN.

COLLID bind option

The COLLID option specifies that any DBRMs in the plan are to be bound to packages.

COLLID	(<i>collection-id</i>) (*)	On: REBIND PLAN
--------	-----------------------------------	-----------------

The resulting packages are then bound to the specified plan. The resulting plan includes only packages. It does not include any DBRMs.

The COLLID option applies to only those plans that were created prior to DB2 10 and have DBRMs bound directly into the plan.

collection-id

Specifies the collection identifier for the new packages.

Specifies that the default collection identifier, DSN_DEFAULT_COLLID_*plan-name*, is to be used for the new packages.

If you do not specify COLLID in REBIND PLAN, and the plan was created prior to DB2 10 and has DBRMs bound directly into it, COLLID(*) is in effect.

Catalog record: Tables SYSPACKAGE, SYSPACKAUTH, SYSPACKDEP, SYSPACKSTMT, and SYSPACKSYSTEM.

CONCENTRATEMT bind option

The CONCENTRATEMT option specifies whether to enforce statement concentration at the package level.

CONCENTRATEMT	(NO) (YES)	On: BIND and REBIND PACKAGE Not valid for REBIND of a native SQL procedure package
----------------------	---------------	--

(NO)

Specifies that statement concentration is not enabled for the package.

([YES])

Specifies that statement concentration is enabled for the package. This option is a package-level alternative to specifying the statement attribute CONCENTRATE STATEMENTS WITH LITERALS in PREPARE statements.

If the CONCENTRATE STATEMENTS attribute is explicitly included in a PREPARE statement, the setting for the prepared statement overrides the CONCENTRATEMT bind option.

Defaults:

Process	Default value
BIND PACKAGE	NO
REBIND PACKAGE	NO

Related concepts

[Reoptimization for statements with replaced literal values \(Db2 Performance\)](#)

Related reference

[PREPARE \(Db2 SQL\)](#)

CONCURRENTACCESSRESOLUTION bind option

The CONCURRENTACCESSRESOLUTION option specifies which concurrent access resolution option to use for statements in a package.

CONCURRENTACCESSRESOLUTION	(WAITFOROUTCOME) (USECURRENTLYCOMMITTED)	On: BIND SERVICE, BIND and REBIND PLAN and PACKAGE, REBIND TRIGGER PACKAGE Not valid for REBIND of a native SQL procedure package
-----------------------------------	---	---

(USECURRENTLYCOMMITTED)

Specifies that when a read transaction requires access to a row that is locked by an INSERT or DELETE operation, the database manager can access the currently committed row, if one exists, and continue to the next row. The read transaction does not need to wait for the INSERT or DELETE operation to commit. This clause applies when the isolation level in effect is cursor stability or read stability.

Under the following circumstances, if USECURRENTLYCOMMITTED is specified for a package, WAITFOROUTCOME behavior is used instead:

- The table space on which the package operates is not a universal table space.
- XML data is being selected, and the data does not support multiple XML versions. In this case, the Db2 database manager cannot determine whether the data has been committed.

(WAITFOROUTCOME)

Specifies that when a read transaction requires access to a row that is locked by an INSERT or DELETE operation, the read transaction must wait for a COMMIT or ROLLBACK operation to complete.

Defaults:

Process	Default value
BIND SERVICE	None
BIND PLAN	None
BIND PACKAGE	None
REBIND PLAN	None
REBIND PACKAGE	None
REBIND TRIGGER PACKAGE	None

CONCURRENTACCESSRESOLUTION has no default. The following table shows how Db2 handles uncommitted INSERTs for all combinations of CONCURRENTACCESSRESOLUTION settings and subsystem parameter SKIPUNCI settings.

Table 8. Db2 behavior for combinations of settings for subsystem parameter SKIPUNCI and bind option CONCURRENTACCESSRESOLUTION

SKIPUNCI value	CONCURRENTACCESSRESOLUTION value	Skip uncommitted INSERTs or wait for COMMIT or ROLLBACK
YES	USECURRENTLYCOMMITTED	Skip uncommitted INSERTs
YES	WAITFOROUTCOME	Wait for COMMIT or ROLLBACK
YES	Not specified	Skip uncommitted INSERTs
NO	USECURRENTLYCOMMITTED	Skip uncommitted INSERTs
NO	WAITFOROUTCOME	Wait for COMMIT or ROLLBACK
NO	Not specified	Wait for COMMIT or ROLLBACK

COPY bind option

The COPY option copies an existing package or service, and names that package or service.

COPY	(collection-id.package-id) (collection-id.package-id) COPYVER (version-id) (collection-id.package-id) COPYVER (version-id) copy-options (collection-id.package-id) copy-options (collection-id.service-name) (collection-id.service-name) COPYVER (version-id) (collection-id.service-name) COPYVER (version-id) copy-options (collection-id.service-name) copy-options	On: BIND PACKAGE, BIND SERVICE
-------------	--	---------------------------------------

Copying the package or service recalculates the access paths in the copy.

To create a remote copy, this option copies SQL statements from a package at your local server. Therefore, you must hold the COPY privilege or its equivalent at the **local** server.

collection-id

The name of the collection that contains the package or service to copy, as listed in column COLLID of catalog table SYSPACKAGE or DSNSERVICE.

collection-id can be an undelimited or a delimited identifier. The delimiter for *collection-id* is double quotation marks ("). If *collection-id* is delimited, Db2 does not convert the value to uppercase. A delimited *collection-id* can include letters, digits, or special characters other than a period (.) or blank.

package-id

The name of the package to copy, as listed in column NAME of catalog table SYSPACKAGE.

package-id can be an undelimited or a delimited identifier. The delimiter for *package-id* is double quotation marks ("). If *package-id* is delimited, Db2 does not convert the value to uppercase. A delimited *package-id* can include letters, digits, or special characters other than a period (.) or blank.

service-name

The name of the service to be copied, as listed in column NAME of catalog table DSNSERVICE.

service-name can be an unlimited or delimited identifier. The delimitator for *service-name* is double quotation marks ("). If *service-name* is delimited, Db2 does not convert the value to uppercase.

COPYVER(version-id)

An optional specification that determines the version of the package or service to copy. For packages, the default version for *version-id* is the empty string. For services, the default for *version-id* is the default service version.

version-id is an undelimited identifier. Db2 does not convert the value to uppercase or change it in any other way.

copy-options

Specifies which bind options are used for the new package or service.

OPTIONS (COMPOSITE)

The option values that are specified in the BIND PACKAGE COPY subcommand are used for the package copy. The values for the options that are not specified, except the values of ENABLE, DISABLE, OWNER, and QUALIFIER, are the option values that are in the SYSPACKAGE catalog table row that describes the source package that is to be copied.

The option values that are specified in the BIND SERVICE COPY subcommand are used for the service copy. The values for the options that are not specified, except the values of ENABLE, DISABLE, OWNER, and QUALIFIER, are the option values that are in the DSNSERVICE and SYSPACKAGE catalog table row that describes the source service that is to be copied.

For a remote copy, OPTIONS(COMPOSITE) is only valid if the remote Db2 subsystem is Db2 Version 8 or later. For BIND SERVICE, the server must be at least Db2 12 for z/OS.

OPTIONS (COMMAND)

The option values that are specified in the BIND PACKAGE COPY or BIND SERVICE COPY subcommand are used for the package or service copy. The values for options that are not specified are determined as follows:

- For a local copy, the Db2-defined BIND PACKAGE or BIND SERVICE options defaults are used.
- For a remote copy, the server-defined BIND PACKAGE or BIND SERVICE option defaults are used at the server. For BIND PACKAGE, you must use OPTIONS(COMMAND) when copying to a down-level server or to a non-z/OS Db2 server. A down-level server is any server that is not Db2 12 for z/OS. For BIND SERVICE, the server must be at least Db2 12 for z/OS.

Restrictions:

- *collection-id.package-id* must identify a package on the local server.
- *collection-id.service-name* must identify a service on the local server.
- You cannot copy to a package or service in the same collection. If you make the copy on the local server, *collection-id* on the COPY option must not name the collection used on the PACKAGE or SERVICE option.

- When the LOCAL date or time format is in effect at the local site, and you use the COPY option to bind a copy of a local package at a remote site, Db2 uses the ISO format for output values in the remote package unless the SQL statement explicitly specifies a different format. Input values in the remote package can be in one of the standard formats, or in a format that is recognized by the server's local date/time exit.
- The following options are mutually exclusive with the COPY option for BIND SERVICE: NAME, VERSION, SQLDDNAME, SQLENCODING, DATE, TIME, DEC, DECDEL, STRDEL.

Defaults:

Process	Default value
BIND PLAN	N/A
BIND PACKAGE	None
BIND SERVICE	None
REBIND PLAN	N/A
REBIND PACKAGE	N/A

COPY has **no default**. If you do not use COPY, you must use MEMBER for BIND PACKAGE or NAME for BIND SERVICE. You cannot use both options.

Copy packages to remote servers: To copy and bind packages from Db2 12 for z/OS to some other server that does not support all the new BIND options in Db2 12, use the OPTIONS(COMMAND) option on BIND PACKAGE COPY. Any options you do not explicitly specify on the BIND PACKAGE subcommand are set to the server's defaults. Using this option can prevent bind errors when you bind and copy packages to servers other than Db2 12 for z/OS.

Copy services to remote servers: When binding and copying a service to a remote server, both servers must be running at least Db2 12 for z/OS.

BIND PACKAGE for remote SQL: To execute SQL statements in the native SQL procedure after a CONNECT SQL statement or SQL statements that contain a three-part name from a remote server, you need a package at the target server. Use the BIND PACKAGE COPY command to specify the following:

- Target location as the target site on the CONNECT/implicit DRDA SQL
- Collection ID as the native SQL procedure's schema
- Package ID as the native SQL procedure's name
- COPYVER as the native SQL procedure's version

Example 1: To copy a version to a remote server using the BIND PACKAGE command, issue::

```
CREATE PROCEDURE TEST.MYPROC LANGUAGE SQL VERSION ABC ...
BEGIN
...
CONNECT TO SAN_JOSE
...
END
BIND PACKAGE(SAN_JOSE.TEST) COPY(TEST.MYPROC) COPYVER(ABC) ACTION(ADD)
```

BIND PACKAGE with SET CURRENT PACKAGESET and SET CURRENT PACKAGE PATH: To use the SQL statements SET CURRENT PACKAGESET and SET CURRENT PACKAGE PATH, you must use the BIND PACKAGE COPY command to specify the following:

- Target collection ID as the target of the SQL statements
- Source collection ID as the native SQL procedure's schema
- Package ID as the native SQL procedure's name
- COPYVER as the native SQL procedure's version

Example 2: To use the SQL statement SET CURRENT PACKAGESET with the BIND PACKAGE command , issue:

```
CREATE PROCEDURE TEST.MYPROC LANGUAGE SQL VERSION ABC ...
BEGIN
...
SET CURRENT PACKAGESET = 'COLL2'
...
END
BIND PACKAGE(COLL2) COPY(TEST.MYPROC) COPYVER(ABC)
ACTION(ADD) QUALIFIER(XYZ)
```

If you need to create a new copy because the native SQL procedure has changed and requires a regeneration, use the BIND COPY ACTION(REPLACE) command.

Catalog record: Column COPY of table SYSPACKAGE.

Example 3: Copy the existing REST service *payroll.getEmployeeSalary* with a version-id of *Ver2*, to a remote server with the location-name PRODSYS.

The new service has the same *collection-id* as the original service. The QUALIFIER option is also specified for the new service which determines the implicit qualifier for unqualified names of tables, views, indexes, and aliases contained in the service created on the PRODSYS system. The DESCRIPTION option is used to describe the newly copied service.

```
BIND SERVICE(PRODSYS."payroll") COPY("payroll"."getEmployeeSalary") COPYVER(Ver2)
QUALIFIER(PRODQUAL) DESCRIPTION('This is the PRODSYS copy of getEmployeeSalary')
```

[Deploying a native SQL procedure to another Db2 for z/OS server \(Db2 Application programming and SQL\)](#)

CURRENTDATA bind option

The CURRENTDATA option determines whether to require data currency for read-only and ambiguous cursors when the isolation level of cursor stability is in effect. It also determines whether block fetching can be used for distributed, ambiguous cursors.

CURRENTDATA	(NO)	On: BIND SERVICE(NO only), BIND and REBIND PLAN and PACKAGE, REBIND TRIGGER PACKAGE
	(YES)	
		Not valid for REBIND of a native SQL procedure package
		Not valid for REBIND of a native REST service

(NO)

Specifies that currency is not required for read-only and ambiguous cursors. Block fetching for distributed, ambiguous cursors is allowed.

If your application attempts to dynamically prepare and execute a DELETE WHERE CURRENT OF statement against an ambiguous cursor, after that cursor is opened, use of CURRENTDATA(NO) is not recommended. You receive a negative SQLCODE if your application attempts a DELETE WHERE CURRENT OF statement for any of the following cursors:

- A cursor that is using block fetching
- A cursor that is using query parallelism
- A cursor that is positioned on a row that is modified by this or another application process

(YES)

Specifies that currency is required for read-only and ambiguous cursors. Db2 acquires page or row locks to ensure data currency. Block fetching for distributed, ambiguous cursors is inhibited.

Restriction for remote rebinds: You cannot use CURRENTDATA when rebinding a package at a remote server. To change the value of CURRENTDATA, you can:

- Issue BIND REPLACE, remotely or locally.
- Free the package and issue BIND ADD, remotely or locally.
- Rebind the package locally at the location where the package resides.

Defaults:

Process	Default value
BIND SERVICE	NO
BIND PLAN	NO
BIND PACKAGE	NO
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column DEFERPREP of table SYSPACKAGE and column EXPREDICATE of table SYSPLAN.

CURRENTSERVER bind option

The CURRENTSERVER option determines the location to connect to before running a plan.

CURRENTSERVER	(<i>location-name</i>)	On: BIND and REBIND PLAN
---------------	--------------------------	--------------------------

The column CURRENTSERVER in catalog table SYSPLAN records the value of *location-name*. The special register CURRENT SERVER also receives that value at the server when the plan is allocated.

You can use CURRENTSERVER to cause a local application to use data from a remote server without changing the application; however, using CURRENTSERVER causes poor performance and should be avoided where possible. Avoid using CURRENTSERVER with applications that contain explicit CONNECT statements.

location-name

The name of the location to connect to. The catalog table SYSIBM.LOCATIONS must contain this name. If the table does not exist, if the table does not contain the DBMS, or if there are no packages at that location, warning messages occur.

SQL return codes: CURRENTSERVER causes Db2 to execute a CONNECT statement. Db2 does not display or report to the application program any warnings that this CONNECT returns. To display the warnings, use explicit CONNECT statements rather than the CURRENTSERVER bind option.

Defaults:

Process	Default value
BIND PLAN	Local database system (regardless of the name of the local location)
BIND PACKAGE	N/A
REBIND PLAN	Existing value
REBIND PACKAGE	N/A

Catalog record: Column CURRENTSERVER of table SYSPLAN.

DBPROTOCOL bind option

The DBPROTOCOL option specifies the protocol to be used when connecting to a remote site.

DBPROTOCOL	(DRDA) (DRDACBF) (BIND and REBIND PACKAGE only)	On: BIND and REBIND PLAN and PACKAGE Not valid for REBIND of a native SQL procedure package Not valid for REBIND of a native REST service
-------------------	--	--

A copy of the package must be bound to each remote site that is referenced by a three-part name statement or a CONNECT statement.

(DRDA)

DBPROTOCOL(DRDA) is passed on BIND PACKAGE, BIND PLAN, REBIND PACKAGE, or REBIND PLAN invocation.

(DRDACBF)

Connections from a Db2 for z/OS requester to a Db2 for z/OS server use package-based continuous block fetch to retrieve read-only result sets from the server.

Package-based continuous block fetch can provide a performance advantage for an application in which all remote SQL statements are read-only queries.

When DRDACBF is specified, the SQL queries in the package that access remote sites must be read-only. Remote UPDATE, DELETE, INSERT and MERGE statements are not allowed. If the application executes a remote statement that creates a unit of recovery on a remote server, the SQL statement fails.

Specify DRDACBF only for packages that meet both of the following conditions:

- The packages are bound on Db2 for z/OS requesters, when application compatibility is set to V11R1 or later.
- The packages connect to Db2 for z/OS servers. When DRDACBF is specified for packages that connect to other types of servers, unpredictable behavior might occur.

Defaults:

Process	Default value
BIND PLAN	DRDA
BIND PACKAGE	DRDA
REBIND PLAN	DRDA
REBIND PACKAGE	DRDA

Catalog record: Column DBPROTOCOL of tables SYSPACKAGE and SYSPLAN.

DATE bind option

The DATE bind option specifies the format of date output that Db2 returns. If a value is not specified, Db2 uses the value specified in the DATE FORMAT field on panel DSNTIP4.

DATE	(EUR) (ISO) (JIS) (LOCAL) (USA)	On: BIND SERVICE
-------------	---	-------------------------

EUR

Use the date format of the IBM standard for Europe.

ISO

Use the date format of the International Standards Organization.

JIS

Use the date format of the Japanese Industrial Standard.

LOCAL

Use the same date format as specified for the ISO value.

USA

Use the date format of the IBM standard for the United States of America.

Defaults:

Process	Default value
BIND SERVICE	The value specified in the DATE FORMAT field of the DSNTIP4 subsystem parameter

[BIND and REBIND options for packages, plans, and services](#)

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

DEC bind option

The DEC bind option specifies the maximum precision to be used in decimal arithmetic operations. If a value is not specified, Db2 uses the value specified in the DECIMAL ARITHMETIC field on panel DSNTIP4.

DEC		On: BIND SERVICE
	(15)	
	(31)	

15

Use the 15-digit precision in decimal arithmetic operations.

31

Use the 31-digit precision in decimal arithmetic operations.

Defaults:

Process	Default value
BIND SERVICE	The value specified in the DECIMAL ARITHMETIC field of the DSNTIP4 subsystem parameter

BIND and REBIND options for packages, plans, and services

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

DECDEL bind option

The DECDEL bind option designates whether a period (.) or a comma (,) is used as the decimal point indicator in decimal and floating point literals. If a value is not specified, DB2 uses the value specified in the DECIMAL POINT IS field on panel DSNTIPF.

DECDEL

(COMMA)
(PERIOD)

On: BIND SERVICE

COMMA

Use a comma (,) as the decimal point indicator.

PERIOD

Use a period (.) as the decimal point indicator.

Defaults:

Process	Default value
BIND SERVICE	The value specified in the DECIMAL POINT IS field of the DSNTIPF subsystem parameter

[BIND and REBIND options for packages, plans, and services](#)

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

DEFER and NODEFER bind options

The DEFER and NODEFER options determine whether to defer preparation for dynamic SQL statements that refer to remote objects, or to prepare them immediately.

NODEFER	NODEFER(PREPARE)	On: BIND SERVICE, BIND and REBIND
DEFER	DEFER(PREPARE)	PLAN and PACKAGE
	DEFER(INHERITFROMPLAN) (Not valid for REBIND of a native REST service)	Not valid for REBIND of a native SQL procedure package

If you defer preparation, the dynamic statement is prepared when Db2 first encounters a statement of the type EXECUTE, OPEN, or DESCRIBE that refers to the dynamic statement.

For BIND and REBIND PACKAGE, if neither option is specified, and REOPT(NONE) applies:

- For local binds, the package inherits the plan's option at run time.
- For remote bind the default is NODEFER(PREPARE) at the remote Db2 server.

If you specify the bind option REOPT(ALWAYS), REOPT(AUTO), or REOPT(ONCE), Db2 sets the bind option DEFER(PREPARE) automatically.

You cannot use both DEFER and NODEFER.

NODEFER(PREPARE)

Does not defer preparation.

DEFER(PREPARE)

Defers preparation.

DEFER(INHERITFROMPLAN)

Enables a local package to inherit the value of the DEFER option from the plan, regardless of whether the package was bound remotely or locally.

If you bind a package remotely with the DEFER(INHERITFROMPLAN) option and the remote server does not understand the INHERITFROMPLAN value, the server might return an error.

The DEFER(INHERITFROMPLAN) value is not applied in the following situations, because no associated plan exists:

- If you bind the application locally and then copy the package to a remote server.
- If you bind an application that uses RRSAF.
- For any packages that are created for utilities

In these cases, NODEFER(PREPARE) is in effect for the package.

DEFER(PREPARE) and distributed processing: Specify the bind option DEFER(PREPARE) to improve performance, instead of NODEFER(PREPARE), and when binding dynamic SQL for DRDA access. Db2 does not prepare the dynamic SQL statement until that statement executes. (The exception to this situation is dynamic SELECT, which combines PREPARE and DESCRIBE, regardless of whether the DEFER(PREPARE) option is in effect.) When a dynamic SQL statement accesses remote data, the PREPARE and EXECUTE statements can be transmitted over the network together and processed at the remote location. Responses to both statements can be sent back to the local subsystem together. This reduces network traffic, which improves the performance of the dynamic SQL statement.

PREPARE statements that contain INTO clauses are not deferred.

To defer the preparation of an SQL statement in an application, bind or rebind the application with the option DEFER(PREPARE). This defers PREPARE messages for SQL statements that refer to a remote object until either:

- The statement executes
- The application requests a description of the results of the statement

If you choose to defer PREPARE statements, after the EXECUTE or DESCRIBE statement, you should code your application to handle any SQL error codes or SQLSTATES that the PREPARE statement might return. You can defer PREPARE statements only if you specify the bind option DEFER(PREPARE).

Defaults:

Process	Default value
BIND PLAN	NODEFER
BIND PACKAGE	Plan value

Process	Default value
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column DEFERPREP of table SYSPLAN and column DEFERPREPARE of table SYSPACKAGE.

DEGREE bind option

The DEGREE option determines whether to attempt to run a query using parallel processing to maximize performance.

DEGREE	(<u>1</u>) (ANY)	On: BIND SERVICE, BIND and REBIND PLAN and PACKAGE Not valid for REBIND of a native SQL procedure package
---------------	-------------------------	---

For plans, DEGREE has no effect.

Limitations: If you bind plans or packages using DEGREE(ANY), the space required in the EDM pool could increase by 50% to 70%.

Defaults:

Process	Default value
BIND SERVICE	1
BIND PLAN	1
BIND PACKAGE	1
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column DEGREE of tables SYSPACKAGE and SYSPLAN.

DEPLOY bind option (deprecated)

The DEPLOY option deploys a compiled SQL function or a native SQL procedure.

Deprecated function: The DEPLOY bind option is deprecated. For best results, deploy compiled SQL functions and native SQL procedures to multiple environments by issuing the same CREATE or ALTER statements separately in each Db2 environment.

DEPLOY	(<i>collection-id.package-id</i>) COPYVER(<i>version-id</i>)	On: BIND PACKAGE
---------------	---	-------------------------

collection-id

The name of the collection that contains the package to deploy, as listed in column COLLID of catalog table SYSPACKAGE.

package-id

The name of the package to deploy, as listed in column NAME of catalog table SYSPACKAGE.

COPYVER (*version-id*)

Determines the version of the package to deploy. The default for *version-id* is the empty string.

version-id is an undelimited identifier. Db2 does not convert the value to uppercase or change it in any other way.

Specify BIND PACKAGE DEPLOY only when the target Db2 is a Db2 for z/OS server. You can use the ADMIN_COMMAND_DSN or DSNACCTS procedure to submit this command from a remote requester environment.

BIND PACKAGE DEPLOY must not be specified for the following:

- A routine package that is obfuscated with the built-in WRAP function
- [FL 507](#) A package that is generated for a version of a procedure using a CREATE statement whose statement text contains an OR REPLACE or SPECIFIC clause

If you specify DEPLOY, the only other options that you can specify are PACKAGE, QUALIFIER, ACTION, OWNER, QUERYACCELERATION, and GETACCELARCHIVE. If you do not specify QUALIFIER or OWNER, their default values are the authorization ID that issues the BIND PACKAGE DEPLOY command.

Using DEPLOY with the ACTION option:

If you specify ACTION(ADD) for a version that does not exist at the target location, Db2 creates or adds a new version of the SQL function or a native SQL procedure and its associated package while keeping the logic from the source object. Db2 adds a new version if an SQL function or a native SQL procedure with the same target name already exists.

If you specify ACTION(REPLACE), Db2 replaces the version specified in COPYVER. If you specify REPLVER, the version ID must be the same as the COPYVER version ID or Db2 returns TSO error message, DSNE977E.

Defaults:

Process	Default value
BIND PLAN	N/A
BIND PACKAGE	None
REBIND PLAN	N/A
REBIND PACKAGE	N/A

DEPLOY has **no default**. If you do not use DEPLOY, you must use MEMBER or COPY.

Catalog record:

Column TYPE of table SYSPACKAGE

Related tasks

[Deploying a native SQL procedure to another Db2 for z/OS server \(Db2 Application programming and SQL\)](#)

DESCRIPTION bind option

The DESCRIPTION bind option briefly describes the Db2 REST service to be bound.

DESCRIPTION	(<i>description-string</i>)	On: BIND SERVICE
-------------	-------------------------------	------------------

description-string

A brief description of the service that can be up to 250 characters in length. If provided, Db2 stores the value in the DESCRIPTION column of the SYSIBM.DSNSERVICE catalog table.

Defaults:

Process	Default value
BIND SERVICE	Zero length string

Related tasks

The FREE SERVICE (DSN) subcommand deletes an application package that represents a Db2 REST service. The command also removes the corresponding entry from the catalog tables.

BIND and REBIND options for packages, plans, and services

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

DESCSTAT bind option

The DESCSTAT option determines whether Db2 builds a SQL descriptor area (SQLDA) when binding static SQL statements. This SQLDA is where Db2 returns names of result table columns for a DESCRIBE CURSOR statement.

DESCSTAT	(NO) (Not valid for REBIND of a native REST service) (YES)	On: BIND SERVICE (YES only), BIND and REBIND PACKAGE, REBIND TRIGGER PACKAGE Not valid for REBIND of a native SQL procedure package
-----------------	---	---

(NO)

Specifies that Db2 does not generate a SQLDA at bind time for static SQL statements. If a DESCRIBE request is received at execution time, Db2 generates an error. However, if the DESCRIBE request comes from a DESCRIBE CURSOR statement, Db2 satisfies the request but provides only data type and length information. Column names are not provided.

(YES)

Specifies that Db2 builds a SQL descriptor area (SQLDA) when binding static SQL statements, so that it can return names of result table columns for a DESCRIBE CURSOR statement. Specifying YES increases the size of some packages because the DESCRIBE SQLDA is now stored with each statically bound SQL SELECT statement.

Defaults

Process	Default value
BIND SERVICE	YES
BIND PLAN	N/A
BIND PACKAGE	<ul style="list-style-type: none">For a local server: The value of subsystem parameter DESCSTAT on the local subsystem is used.For a remote server: The value of subsystem parameter DESCSTAT on the remote subsystem is used.
REBIND PLAN	N/A
REBIND PACKAGE	Existing value. If there is no existing value, the DESCSTAT subsystem parameter value is used.
REBIND TRIGGER PACKAGE	Existing value. If there is no existing value, the DESCSTAT subsystem parameter value is used.

Catalog record

Column DESCSTAT of table SYSPACKAGE.

Related reference

[DESCRIBE FOR STATIC field \(DESCSTAT subsystem parameter\) \(Db2 Installation and Migration\)](#)

DISCONNECT bind option

The DISCONNECT option determines which remote connections to destroy during commit operations.

DISCONNECT	(<u>EXPLICIT</u>) (AUTOMATIC) (CONDITIONAL)	On: BIND and REBIND PLAN
-------------------	---	---------------------------------

The option applies to any application process that uses the plan and has remote connections of any type. Regardless of the value of this option, a commit operation destroys all connections in the release pending state. You can put a connection in the release pending state using the SQL statement RELEASE.

(EXPLICIT)

Destroy only connections in the release pending state. This value allows you maximum flexibility for controlling remote connections.

(AUTOMATIC)

Destroy all remote connections.

(CONDITIONAL)

Destroy all remote connections unless an open cursor defined as WITH HOLD is associated with the connection.

Defaults:

Process	Default value
BIND PLAN	EXPLICIT
BIND PACKAGE	N/A
REBIND PLAN	Existing value
REBIND PACKAGE	N/A

Catalog record: Column DISCONNECT of table SYSPLAN.

DYNAMICRULES bind option

The DYNAMICRULES option determines the rules that apply at run time for certain dynamic SQL attributes.

DYNAMICRULES	(RUN) (BIND) (DEFINEBIND) (DEFINERUN) (INVOKEBIND) (INVOKERUN)	On: BIND and REBIND PLAN and PACKAGE Not valid for REBIND of a native SQL procedure package Not valid for REBIND of a native REST service
---------------------	---	--

If DYNAMICRULES is specified for BIND PLAN, the DYNAMICRULES value has an effect only if any of the following conditions are true:

- The MEMBER option is specified. In that case, the generated package inherits the DYNAMICRULES value from the BIND PLAN command. If DYNAMICRULES is specified for REBIND PLAN, the DYNAMICRULES value has no effect.
- An existing package has no DYNAMICRULES value. If BIND PLAN with a DYNAMICRULES value is issued, and the package list includes a package without a DYNAMICRULES value, the package inherits the DYNAMICRULES value from the plan when the package runs.

If DYNAMICRULES is specified for REBIND PLAN, the DYNAMICRULES value has an effect only if an existing package has no DYNAMICRULES value. If REBIND PLAN with a DYNAMICRULES value is issued, and the package list includes the package without a DYNAMICRULES value, the package inherits the DYNAMICRULES value from the plan when the package runs.

The dynamic SQL attributes that DYNAMICRULES affects are:

- The authorization ID that is used to check authorization
- The qualifier that is used for unqualified objects
- The source for application programming options that Db2 uses to parse and semantically verify dynamic SQL statements
- Whether dynamic SQL statements can include GRANT, REVOKE, ALTER, CREATE, DROP, and RENAME statements

In addition to the DYNAMICRULES value, the run time environment of a package controls how dynamic SQL statements behave at run time. The two possible run time environments are:

- The package runs as part of a stand-alone program
- The package runs as a stored procedure or user-defined function package, or runs under a stored procedure or user-defined function

The combination of the DYNAMICRULES value and the run time environment determine the values for the dynamic SQL attributes. That set of attribute values is called the dynamic SQL statement *behavior*. The four behaviors are:

- Run behavior
- Bind behavior
- Define behavior
- Invoke behavior

The following DYNAMICRULES option descriptions include a description of the dynamic SQL statement behavior for each run time environment. This information is summarized in [Table 9 on page 106](#).

(RUN)

Processes dynamic SQL statements using the standard attribute values for dynamic SQL statements, which are collectively called *run behavior*:

- Db2 uses the authorization ID of the application process and the SQL authorization ID (the value of the CURRENT SQLID special register) for authorization checking of dynamic SQL statements.
- Db2 uses the value of the CURRENT SCHEMA special register as the default schema of table, view, index, and alias names.
- Dynamic SQL statements use the values of application programming options that were specified during installation. The installation option USE FOR DYNAMICRULES has no effect.
- GRANT, REVOKE, CREATE, ALTER, DROP, and RENAME statements can be executed dynamically.

(BIND)

Processes dynamic SQL statements using the following attribute values, which are collectively called *bind behavior*:

- Db2 uses the authorization ID of the package for authorization checking of dynamic SQL statements.
- Unqualified table, view, index, and alias names in dynamic SQL statements are implicitly qualified with value of the bind option QUALIFIER; if you do not specify QUALIFIER, Db2 uses the authorization ID of the package owner as the default schema.

- The attribute values that are described in [Common attribute values for bind, define, and invoke behaviors](#).
- If you are running a trusted context with a role, or when the owner is a role, Db2 uses the authorization ID of the owner of the package for authorization checking of dynamic SQL statements. The same rules that are used to determine the authorization ID for static (embedded) statements are used for dynamic statements. Db2 uses the authorization ID of the owner of the package for authorization checking of dynamic SQL statements. The privilege set is the privileges that are held by the authorization ID of the owner of the package. The owner can also be a role. The identifier specified in the QUALIFIER option of the bind command that is used to bind the SQL statements is the implicit qualifier for all unqualified tables, views, aliases, indexes, and sequences. If this bind option was not used when the package was created or last rebound, the implicit qualifier is the authorization ID of the owner of the package. The owner can also be a role.

(DEFINEBIND)

Processes dynamic SQL statements using one of two behaviors, *define behavior* or *bind behavior*.

When the package is run as or runs under a stored procedure or user-defined function package, Db2 processes dynamic SQL statements using define behavior, which consists of the following attribute values:

- Db2 uses the authorization ID of the user-defined function or stored procedure owner for authorization checking of dynamic SQL statements in the application package.
- The default qualifier for unqualified objects is the user-defined function or stored procedure owner.
- The attribute values that are described in [Common attribute values for bind, define, and invoke behaviors](#).
- If you are running a trusted context with a role, or when the owner is a role, then define behavior applies only if the dynamic SQL statement is in a package that is run as a stored procedure or user-defined function (or runs under a stored procedure or user-defined function package), and the package is bound with DYNAMICRULES (DEFINEBIND). Db2 uses the authorization ID of the stored procedure or user-defined function owner for authorization checking of dynamic SQL statements in the application package. This can be a primary or secondary authorization ID or a role. In this case, the privilege set is the privileges that are held by the authorization ID of the stored procedure or user-defined function owner. This owner can be a primary or secondary authorization ID or a role. The authorization ID of the stored procedure or user-defined function owner is also the implicit qualifier for unqualified table, view, alias, index, and sequence names. The owner can also be a role.

When the package is run as a stand-alone program, Db2 processes dynamic SQL statements using bind behavior, which is described in [BIND keyword](#).

(DEFINERUN)

Processes dynamic SQL statements using one of two behaviors, *define behavior* or *run behavior*.

When the package is run as or runs under a stored procedure or user-defined function package, dynamic SQL statements have define behavior, which is described in [DEFINEBIND keyword](#).

When the package is run as a stand-alone program, Db2 processes dynamic SQL statements using run behavior, which is described in [RUN keyword](#).

If you are running a trusted context with a role, or when the owner is a role, then define behavior applies only if the dynamic SQL statement is in a package that is run as a stored procedure or user-defined function (or runs under a stored procedure or user-defined function package), and the package is bound with DYNAMICRULES (DEFINERUN). Db2 uses the authorization ID of the stored procedure or user-defined function owner for authorization checking of dynamic SQL statements in the application package. This can be a primary or secondary authorization ID or a role. In this case, the privilege set is the privileges that are held by the authorization ID of the stored procedure or user-defined function owner. This owner can be a primary or secondary authorization ID or a role. The authorization ID of the stored procedure or user-defined function owner is also the implicit qualifier for unqualified table, view, alias, index, and sequence names. The owner can also be a role.

(INVOKEBIND)

Processes dynamic SQL statements using one of two behaviors, *invoke behavior* or *bind behavior*.

When the package is run as or runs under a stored procedure or user-defined function package, Db2 processes dynamic SQL statements using invoke behavior, which consists of the following attribute values:

- Db2 uses the authorization ID of the user-defined function or stored procedure invoker for authorization checking of dynamic SQL statements in the application package.

If the invoker is the primary authorization ID of the process or the CURRENT SQLID value, secondary authorization IDs are also checked if they are needed for the required authorization. Otherwise, only one ID, the ID of the invoker, is checked for the required authorization.

- The default qualifier for unqualified objects is the user-defined function or stored procedure invoker.
- The attribute values that are described in [Common attribute values for bind, define, and invoke behaviors](#).
- If you are running a trusted context with a role, or when the owner is a role, then invoke behavior applies only if the dynamic SQL statement is in a package that is run as a stored procedure or user-defined function (or runs under a stored procedure or user-defined function package), and the package was bound with DYNAMICRULES(INVOKEBIND). Db2 uses the authorization ID of the stored procedure or user-defined function invoker for authorization checking of dynamic SQL statements in the application package. The invoker can also be a role. The privilege set is the privileges that are held by the authorization ID of the stored procedure or user-defined function invoker. However, if the invoker is the primary authorization ID of the process or the CURRENT SQLID value, secondary authorization IDs are also checked along with the primary authorization ID's role. Therefore, the privilege set is the union of the set of privileges held by each authorization ID of the process and the primary authorization ID's role. The authorization ID of the stored procedure or user-defined function invoker is also the implicit qualifier for unqualified table, view, alias, index, and sequence names. The invoker can also be a role.

When the package is run as a stand-alone program, Db2 processes dynamic SQL statements using bind behavior, which is described in [BIND keyword](#).

(INVOKERUN)

Processes dynamic SQL statements using one of two behaviors, *invoke behavior* or *run behavior*.

When the package is run as or runs under a stored procedure or user-defined function package, Db2 processes dynamic SQL statements using invoke behavior, which is described in [INVOKEBIND keyword](#).

If you are running a trusted context with a role, or when the owner is a role, then invoke behavior applies only if the dynamic SQL statement is in a package that is run as a stored procedure or user-defined function (or runs under a stored procedure or user-defined function package), and the package was bound with DYNAMICRULES(INVOKERUN). Db2 uses the authorization ID of the stored procedure or user-defined function invoker for authorization checking of dynamic SQL statements in the application package. The invoker can also be a role. The privilege set is the privileges that are held by the authorization ID of the stored procedure or user-defined function invoker. However, if the invoker is the primary authorization ID of the process or the CURRENT SQLID value, secondary authorization IDs are also checked along with the primary authorization ID's role. Therefore, the privilege set is the union of the set of privileges held by each authorization ID of the process and the primary authorization ID's role. The authorization ID of the stored procedure or user-defined function invoker is also the implicit qualifier for unqualified table, view, alias, index, and sequence names. The invoker can also be a role.

When the package is run as a stand-alone program, Db2 processes dynamic SQL statements using run behavior, which is described in [RUN keyword](#).

Common attribute values for bind, define, and invoke behavior: The following attribute values apply to dynamic SQL statements in packages that have bind, define, or invoke behavior:

- You can execute the statement SET CURRENT SQLID in a package that is bound with any DYNAMICRULES value. However, Db2 does not use the value of CURRENT SQLID as the authorization ID for dynamic SQL statements.

Db2 always uses the value of CURRENT SQLID as the qualifier for the EXPLAIN output and optimizer hints input PLAN_TABLE. (If the value of CURRENT SQLID has an alias on PLAN_TABLE and has the appropriate privileges, that PLAN_TABLE is populated.)

- If the value of installation option USE FOR DYNAMICRULES is YES, Db2 uses the application programming default values that were specified during installation to parse and semantically verify dynamic SQL statements. If the value of USE for DYNAMICRULES is NO, Db2 uses the precompiler options to parse and semantically verify dynamic SQL statements.
- GRANT, REVOKE, CREATE, ALTER, DROP, and RENAME statements cannot be executed dynamically.

Remote Db2 servers: For a package that uses DRDA access, Db2 sends the DYNAMICRULES option to the Db2 server at bind time.

The following table summarizes the dynamic SQL statement attribute values for each behavior.

Table 9. Definitions of dynamic SQL statement behaviors

Dynamic SQL attribute	Value for bind behavior	Value for run behavior	Value for define behavior	Value for invoke behavior
Authorization ID	Package OWNER	Current SQLID	User-defined function or stored procedure owner	Authorization ID of invoker
Default qualifier for unqualified objects	Bind OWNER or QUALIFIER value	Current SQLID	User-defined function or stored procedure owner	Authorization ID of invoker
CURRENT SQLID	Initialized to primary authid. SET SQLID is allowed.	Initialized to primary authid. SET SQLID is allowed.	Initialized to primary authid. SET SQLID is allowed.	Initialized to primary authid. SET SQLID is allowed.
Source for application programming options	As determined by the application defaults parameter DYNRULS	Application programming defaults installation panels	As determined by the application defaults parameter DYNRULS	As determined by the application defaults parameter DYNRULS
Can execute GRANT, REVOKE, CREATE, ALTER, DROP, RENAME?	No	Yes	No	No

Defaults:

Process	Default value
BIND PLAN	RUN
BIND PACKAGE	blank, or RUN for packages that run on a remote Db2 for z/OS server. “1” on page 106 , “2” on page 106
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Note:

1. When the package value is blank, the value that is used when the package is run is inherited from the plan value.
2. The default for a package on a remote Db2 for z/OS server is RUN. The default is set by the server.

Catalog record: Column DYNAMICRULES of tables SYSPACKAGE and SYSPLAN.

Related concepts

ENABLE and DISABLE bind options

The ENABLE and DISABLE options determines which connections can use a plan or package.

ENABLE	(*)	On: BIND and REBIND PLAN and PACKAGE
DISABLE	(BATCH)	
	(CICS)	
	(CICS) CICS (<i>applid</i> , ...)	Not valid for REBIND of a native SQL procedure package
	(DB2CALL)	
	(DLIBATCH)	
	(DLIBATCH) DLIBATCH (<i>connection-name</i> , ...)	Not valid for REBIND of a native REST service
	(IMS)	
	(IMSBMP)	
	(IMSBMP) IMSBMP (<i>imsid</i> , ...)	
	(IMSMPP)	
	(IMSMPP) IMSMPP (<i>imsid</i> , ...)	
	(REMOTE) (BIND and REBIND PACKAGE only)	
	(RRSF)	

You cannot use both DISABLE and ENABLE. For packages, DISABLE and ENABLE are valid only for local bind operations.

ENABLE

Lists the system connection types that can use the plan or package. Connection types not listed cannot use it.

DISABLE

Lists the system connection types that cannot use the plan or package. Connection types not listed can use it.

With some connection types you can list connection IDs to identify specific connections of the type to disable or enable.

If you list connection IDs as disabled, any connections not listed for the same connection type are enabled.

If you list connection IDs as enabled, any connections not listed for the same connection type are disabled.

A connection ID is valid only after the keyword that names its corresponding connection type.

Connection types:

(*)

Specifies all valid connection types. Use only with ENABLE.

(BATCH)

Indicates that all TSO connections are either enabled or disabled for the plan or package.

(CICS)

Identifies the CICS Connection. All CICS VTAM node names specified in the CICS SIT table are either enabled or disabled for the plan or package.

(CICS) CICS (*applid* , ...)

Identifies the CICS VTAM node name specified in the APPLID parameter of the CICS SIT table. The CICS VTAM node identified by *applid* is either enabled or disabled for the plan or package.

(DB2CALL)

Indicates that the call attachment facility (CAF) connection is either enabled or disabled for the plan or package.

(DLIBATCH)

Identifies the Data Language I (DL/I) Batch Support Facility connection. All connection identifiers from the DDITV02 data set or the job name in the JCL that the DL/I batch support system needs to have are either enabled or disabled for the plan or package.

(DLIBATCH) DLIBATCH (*connection-name* , ...)

Specifies the connection identifier as from the DDITV02 data set or the job name in the JCL that the DL/I batch support system needs to have. The DL/I batch connection identified by *connection-name* is either enabled or disabled for the plan or package.

(IMS)

Specifies that all Information Management System (IMS) connections, DLIBATCH, IMSBMP, and IMSMPP are either enabled or disabled for the plan or package.

(IMSBMP)

Specifies the IMS connection for the Batch Message Program (BMP) region. All IMS BMP connections identified by the value of IMSID on the CTL parameter EXEC are either enabled or disabled for the plan or package.

(IMSBMP) IMSBMP (*imsid* , ...)

Specifies the value of IMSID on the CTL parameter EXEC. The IMS BMP connection identified by *imsid* is either enabled or disabled for the plan or package.

(IMSMPP)

Specifies the IMS connection for the Message Processing Program (MPP) and IMS Fast Path (IFP) regions. All IMS MPP connections identified by the value of the IMSID on the CTL parameter EXEC. are either enabled or disabled for the plan or package.

(IMSMPP) IMSMPP (*imsid* , ...)

Specifies the value of IMSID on the CTL parameter EXEC. The IMS MPP connection identified by *imsid* is either enabled or disabled for the plan or package.

(REMOTE)

Indicates that all remote connections are either enabled or disabled for the package.

(RRSF)

Indicates that the RRS attachment facility connection is either enabled or disabled for the plan or package.

Plans that disable a system: If a plan disables a system, then no packages appended to that plan can run from that system, regardless of the ENABLE/DISABLE options. However, if the same packages are appended to other plans that enable the system, those packages can run from that system under those plans.

Interactions with the PLANMGMT option: If you plan to change either of these options and the PLANMGMT option in a REBIND command, see [“PLANMGMT bind option” on page 127](#) for information about the implications.

Defaults:

Process	Default value
BIND PLAN	ENABLE(*)
BIND PACKAGE	ENABLE(*)
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Table SYSPKSYSTEM for packages and table SYSPLSYSTEM for plans.

ENCODING bind option

The ENCODING option specifies the application encoding for all host variables in static statements in a plan or package.

ENCODING	(ASCII)(EBCDIC)(UNICODE)(ccsid)	On: BIND SERVICE(UNICODE only), BIND and REBIND PLAN and PACKAGE
		Not valid for REBIND of a native SQL procedure package
		Not valid for REBIND of a native REST service

EBCDIC is the only valid option for a plan or package that was precompiled prior to DB2 Version 7. If you specify *ccsid* on any plan or package precompiled prior to DB2 Version 7, the value of *ccsid* must match the EBCDIC CCSID specified on the installation panel DSNTIPF (the SYSTEM EBCDIC CCSID). You can specify ASCII, UNICODE, or *ccsid*, where *ccsid* is a value other than the SYSTEM EBCDIC CCSID for any plan or package precompiled on DB2 Version 7 or later. You might select this option when a data source, such as a terminal emulator, uses a CCSID that is not the same as the SYSTEM EBCDIC CCSID. For example, a user has a terminal emulator with a CCSID of 1047, but the SYSTEM EBCDIC CCSID is 37. In this case, the plan or package being used by that user should be bound with ENCODING (1047).

ENCODING also affects the content of the data that is returned by the SQL statement DESCRIBE. Db2 will return column names, label names, or both (if requested) in the specified application encoding scheme.

Defaults: The default package application encoding scheme is not inherited from the plan application encoding option. The default for a package that is bound on a remote Db2 for z/OS system is the remote server's default application encoding scheme. Similarly, when a plan or package is run on a remote Db2 for z/OS server, the specified ENCODING option is ignored. Instead, the remote server's encoding scheme is used.

The following statements set the value of the host variable and do not require the package to be bound into the plan:

```
SET CURRENT PACKAGE SET = :HV ,
SET :HV = CURRENT PACKAGE SET ,
SET :HV = CURRENT PACKAGE PATH ,
SET CURRENT PACKAGE PATH = :HV
```

The host variable uses the system default application encoding scheme, even when the application is bound with the ENCODING (EBCDIC/UNICODE) bind option.

Defaults:

Process	Default value
BIND PLAN	The system default application encoding scheme that was specified at installation time
BIND PACKAGE	The system default application encoding scheme that was specified at installation time
BIND SERVICE	UNICODE
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column ENCODING_CCSID of table SYSPLAN or SYSPACKAGE. The value is set as follows:

- For a MIXED=NO subsystem, if ENCODING(ASCII) or ENCODING(EBCDIC) is specified, the SBCS CCSID of the encoding scheme is stored in the catalog.

- For a MIXED=YES subsystem, if ENCODING(ASCII) or ENCODING(EBCDIC) is specified, the mixed CCSID of the encoding scheme is stored in the catalog.
- If ENCODING(UNICODE) is specified, the mixed CCSID (1208) is stored in the catalog, regardless of the MIXED setting.

EXPLAIN bind option

The EXPLAIN option causes the bind process to obtain information about how SQL statements in the package or packages are to execute.

PSPI

EXPLAIN	(NO) (YES) (ONLY)(Not valid for REBIND of a native REST service)	On: BIND SERVICE (YES NO), BIND and REBIND PLAN and PACKAGE, REBIND TRIGGER PACKAGE
----------------	--	--

The bind process inserts that information into the table *owner*.PLAN_TABLE. *owner* can be the authorization ID of the owner of the plan or package. Alternatively, the authorization ID of the owner of the plan or package can have an alias as *owner*.PLAN_TABLE that points to the base table, PLAN_TABLE. *owner* must also have the appropriate SELECT and INSERT privileges on that table. This option does not obtain information for statements that access remote objects.

PLAN_TABLE must have a base table and can have multiple aliases with the same table name, PLAN_TABLE, but using different authorization IDs; it cannot be a view or a synonym. It should exist before the bind process begins.

The EXPLAIN option also populates all of the explain tables, except for the following:

- DSN_QUERY_TABLE
- DSN_STATEMENT_CACHE_TABLE

You can get EXPLAIN output for a statement that is embedded in a program that is bound with EXPLAIN(NO) by embedding the SQL statement EXPLAIN in the program. Otherwise, the value of the EXPLAIN option applies to all explainable SQL statements in the program, and to the fullselect portion of any DECLARE CURSOR statements.

In all inserts to *owner*.PLAN_TABLE, the value of QUERYNO is the statement number that the precompiler assigned and placed in the DBRM.

For automatic rebind: EXPLAIN(YES) is in effect if you bind the plan or package with EXPLAIN(YES) and if the value of field EXPLAIN PROCESSING on installation panel DSNTIPO is YES. If EXPLAIN(YES) and VALIDATE(BIND) are in effect and PLAN_TABLE is not correct, the automatic rebind fails.

(NO)

Provides no EXPLAIN information.

(YES)

Inserts information in the tables that are populated by EXPLAIN. No secondary authorization checks for the owner authorization ID are performed during the bind operation. You must grant all privileges and authorities directly to the owner authorization ID. If *owner*.PLAN_TABLE does not exist at bind time, the value of the option VALIDATE determines the success of the bind operation.

- If the value is BIND, the bind fails.
- If the value is RUN, Db2 checks to see if the table exists again at run time. If it still does not exist, the plan or package cannot run. If it does exist, Db2 inserts information in PLAN_TABLE before the plan or package runs.

If neither or both of the optional tables DSN_FUNCTION_TABLE or DSN_STATEMENT_TABLE exist, or if they are defined incorrectly, the bind does not fail.

(ONLY)

Inserts information in the tables that are populated by EXPLAIN. When EXPLAIN(ONLY) is specified, Db2 does not insert a new row or update a row in catalog table SYSIBM.SYSPACKAGE, or permanently insert or update a package in the directory. However, when EXPLAIN(ONLY) is specified, Db2 uses all the resources that it uses for a regular BIND or REBIND. For example, during EXPLAIN(ONLY) processing, Db2 acquires the same locks as it acquires during regular BIND or REBIND processing.

EXPLAIN(ONLY) allows EXPLAIN to be run when the authorization ID of the bind or rebind process does not have the privilege to execute statements in the package. If the command that specifies EXPLAIN(ONLY) refers to a package and version that already exists, the existing package is not dropped or replaced, even if ACTION(REPLACE) is specified. If an error is encountered during population of the EXPLAIN tables, information is not added to the EXPLAIN tables for the statement where the error occurred, and for any subsequent statements.

The EXPLAIN(ONLY) option is also useful for testing whether access paths can be successfully reused before you bind or rebind a package with the APREUSE(ERROR) or APCOMPARE(ERROR) bind options. When EXPLAIN(ONLY) is specified with those options, the PLAN_TABLE is populated with information about all statements in a package, even when reuse or comparison fails for the access path for one or more statements. You can examine the HINT_USED and REMARKS columns to discover which statements in the package that cannot be reused. The access path described by the PLAN_TABLE data for a statement when access path reuse fails describes the new access path that Db2 selects when no reuse or APREUSE(WARN) is specified.

A 'Y' value in the BIND_EXPLAIN_ONLY column indicates PLAN_TABLE rows that are created under this option.

Invalidation resulting from an unsuccessful rebind: An unsuccessful rebind generating a return code of greater than 4 invalidates the rebind object and rolls back all changes to the object, leaving it as it was before the rebind attempt. However, if the rebind fails because of either the REBIND option EXPLAIN or the SQL statement EXPLAIN (that is, the PLAN_TABLE does not exist or was created incorrectly), Db2 rolls back all changes to the object but does not invalidate the object.

Defaults:

Process	Default value
BIND SERVICE	NO
BIND PLAN	NO
BIND PACKAGE	NO
REBIND PLAN	NO
REBIND PACKAGE	Existing value

Catalog record: Column EXPLAIN of table SYSPACKAGE and column EXPLAIN of SYSPLAN.

EXTENDEDINDICATOR bind option

The EXTENDEDINDICATOR option determines whether Db2 recognizes extended indicator variables when the associated package is run.

EXTENDEDINDICATOR

EXTENDEDINDICATOR	(<u>NO</u>) (YES)	On: BIND and REBIND PACKAGE Not valid for REBIND of a native SQL procedure package Not valid for REBIND of a native REST service
--------------------------	--------------------------	---

(NO)

Specifies that Db2 does not recognize extended indicator variable values. Indicator variables are normal indicator variables; negative indicator variable values are null, and positive or zero indicator variable values are non-null.

(YES)

Specifies that Db2 recognizes extended indicator variable values. If you use any non-recognized indicator variable values or default or unassigned indicator variable-based values in a non-supported location, Db2 generates an error message when the bound statement is running.

Defaults:

Process	Default value
BIND PLAN	N/A
BIND PACKAGE	NO
REBIND PLAN	N/A
REBIND PACKAGE	Existing value

Catalog record: Column EXTENDEDINDICATOR of table SYSPACKAGE.

FILTER bind option

The FILTER option lets you delete a set of queries in the SYSIBM.SYSQUERY table under a {tag} value that is specified by the SYSQUERY.USERFILTER column.

FILTER	(' <u>filter-name</u> ')	On: FREE QUERY
---------------	----------------------------	-----------------------

('filter-name')

Related reference

FREE QUERY (DSN)

The DSN subcommand FREE QUERY removes from certain catalog tables for one or more queries. If any of the specified queries are in the dynamic statement cache, FREE QUERY purges them from the dynamic statement cache.

SYSQUERY catalog table (Db2 SQL)

FLAG bind option

The FLAG option determines the messages to display during the bind process.

FLAG	(<u>I</u>)(W)(E)(C)	On: BIND and REBIND PLAN and PACKAGE, REBIND TRIGGER PACKAGE Not valid for REBIND of a native SQL procedure package
-------------	-----------------------------	--

- (I)
All informational, warning, error, and completion messages
- (W)
Only warning, error, and completion messages
- (E)
Only error and completion messages
- (C)
Only completion messages

Rebinding multiple plans or packages: When your REBIND command contains an asterisk (*) and affects many plans or packages, FLAG(E) is recommended to avoid running out of message storage.

Defaults:

Process	Default value
BIND PLAN	I
BIND PACKAGE	I
REBIND PLAN	I
REBIND PACKAGE	I
REBIND TRIGGER PACKAGE	I

GENERIC bind option

The GENERIC option specifies one or more bind options that are supported by the target server, but are not supported as options for BIND PACKAGE or REBIND PACKAGE on the Db2 for z/OS subsystem on which the BIND or REBIND command is issued.

GENERIC	('string')	On: BIND and REBIND PACKAGE Not valid for REBIND of a native SQL procedure package Not valid for REBIND of a native REST service
----------------	--------------	---

Do not use GENERIC to specify any of the following options:

- Bind options that are explicitly supported by Db2 for z/OS for BIND PACKAGE or REBIND PACKAGE
- SQL processing options that are explicitly supported by Db2 for z/OS

('string')
One or more pairs of a bind option and its corresponding value. Separate each item by one or more blank spaces.

For example, the following GENERIC option specifies several bind options and their corresponding values:

```
GENERIC( ' option-1 value-1 option-2 value-2..... option-n value-n ' )
```

In this example, *value-1* is specified for bind option *option-1*, *value-2* is specified for bind option *option-2*, and so on.

If you specify a bind option more than once in the GENERIC string, only the first occurrence is used. All subsequent occurrences of the bind option and its corresponding value are ignored. For example, suppose that you specify the following GENERIC option:

```
GENERIC( ' firstoption firstvalue secondoption secondvalue firstoption thirdvalue' )
```

In this example, *firstoption* and *secondoption* are bind options that are sent to the target server with their corresponding values. The third option and value pair (*firstoption thirdvalue*) is ignored, because *firstoption* is already specified in the string. This pair is not sent to the target server.

The maximum length of the string is 4096 bytes. Within that string, each individual option name cannot exceed 255 characters, and each individual option value cannot exceed 255 characters.

GETACCELARCHIVE bind option

The GETACCELARCHIVE bind option specifies whether a static SQL query that is bound for acceleration retrieves archived data on the accelerator, instead of active data. If the bind option is specified, it also provides the initial value for the CURRENT GET_ACCEL_ARCHIVE special register that is used for dynamic queries, if a SET statement has not been issued for the special register.

When a package that is bound with this bind option runs, the GETACCELARCHIVE value, instead of the GET_ACCEL_ARCHIVE subsystem parameter, provides the initial value for the CURRENT GET_ACCEL_ARCHIVE special register. The CURRENT GET_ACCEL_ARCHIVE special register specifies whether a query that references a table that is archived on an accelerator server uses the archived data. Therefore, by rebinding the application package with the GETACCELARCHIVE bind option, you can also specify that accelerated dynamic SQL queries in an application retrieve only archived data on the accelerator. You can specify this bind option instead of either modifying the application to add an explicit SET CURRENT GET_ACCEL_ARCHIVE statement or setting the GET_ACCEL_ARCHIVE subsystem parameter. For dynamic SQL queries in a package, the bind option value that is specified overrides the GET_ACCEL_ARCHIVE subsystem parameter. This bind option does not have a default value, so if you do not specify this bind option, the GET_ACCEL_ARCHIVE subsystem parameter initializes the special register.

GETACCELARCHIVE

(NO)
(YES)

**On: BIND PACKAGE,
REBIND PACKAGE**

Not valid for REBIND of
a native SQL procedure
package

(NO)

Specifies that no static SQL query is bound to retrieve archived data from the accelerator. If the static query also is not bound for acceleration, the query is bound to run in Db2.

If the static query is bound for acceleration because the QUERYACCELERATION bind option was specified, the query is routed to the accelerator when the application runs; however, the query does not retrieve any archived data.

(YES)

Specifies that if all of the following criteria are met, the query is bound for acceleration and retrieves the archived data on the accelerator when the application runs:

- The QUERYACCELERATION bind option is also specified.
- The static SQL query references an accelerated table that has partitioned data archived on an accelerator.
- The static query satisfies the acceleration criteria that is specified by the QUERYACCELERATION bind option.

If the static query does not satisfy the acceleration criteria that is specified by the QUERYACCELERATION bind option, the BIND or REBIND PACKAGE operation fails with an error message for that query.

Defaults:

Process	Default value
BIND PACKAGE	None
REBIND PACKAGE	None

There is no default value for this bind option. The GETACCELARCHIVE bind option does not inherit the setting from the GET_ACCEL_ARCHIVE subsystem parameter.

IMMEDWRITE bind option

The IMMEDIATEWRITE option indicates whether immediate writes are to be done for updates that are made to group buffer pool dependent page sets or partitions.

IMMEDWRITE	(NO) (YES) (INHERITFROMPLAN) (BIND PACKAGE and REBIND PACKAGE only; Not valid for REBIND of a native REST service)	On: BIND SERVICE, BIND and REBIND PLAN and PACKAGE, and REBIND TRIGGER PACKAGE Not valid for REBIND of a native SQL procedure package
-------------------	---	---

This option is only applicable for data sharing environments. The IMMEDIATEWRITE subsystem parameter has no effect on the IMMEDIATEWRITE bind option at bind time. The following table shows the implied hierarchy of this option as it affects run time. The IMMEDIATEWRITE option values are as follows:

- (NO)**

Specifies that normal write activity is done. Updated pages that are group buffer pool dependent are written at or before phase one of commit or at the end of abort for transactions that have rolled back.
- (YES)**

Specifies that updated pages that are group buffer pool dependent are immediately written as soon as the buffer update completes. Updated pages are written immediately even if the buffer is updated during forward progress or during rollback of a transaction. Specifying this option might impact performance.
- (INHERITFROMPLAN)**

Enables a local package to inherit the value of the IMMEDIATEWRITE option from the plan, regardless of whether the package was bound remotely or locally.

If you bind a package remotely with the IMMEDIATEWRITE(INHERITFROMPLAN) option and the remote server does not understand the INHERITFROMPLAN value, the server might return an error.

The IMMEDIATEWRITE(INHERITFROMPLAN) value is not applied in the following situations, because no associated plan exists:

 - If you bind the application locally and then copy the package to a remote server.
 - If you bind an application that uses RRSAF.
 - For any packages that are created for utilities

In these cases, IMMEDIATEWRITE(NO) is in effect for the package.

Table 10. The implied hierarchy of the IMMEDIATE option

IMMEDIATE bind option	IMMEDIATE subsystem parameter	Value at run time
NO	NO	NO
NO	PH1	PH1
NO	YES	YES
PH1	NO	PH1
PH1	PH1	PH1
PH1	YES	YES
YES	NO	YES
YES	PH1	YES
YES	YES	YES

Note: The NO and PH1 options are equivalent. The PH1 option is shown for backward compatibility only.

Interactions with the PLANMGMT option: If you plan to change this option and the PLANMGMT option in a REBIND command, see [“PLANMGMT bind option” on page 127](#) for the implications.

Performance implications: You can use IMMEDIATE(NO) and IMMEDIATE(YES) for situations where a transaction spawns another transaction that can run on another Db2 member and that depends on uncommitted updates that were made by the originating transaction.

Specify IMMEDIATE(NO) to cause group buffer pool dependent pages to be written at or before phase 1 of commit.

Specify IMMEDIATE(YES) to cause the originating transaction to immediately write its updated GBP-dependent buffers (instead of waiting until the end of commit or rollback), which will ensure that the dependent transaction always gets the same results regardless of whether it runs on the same member or a different member as the originating transaction. IMMEDIATE(YES) should be used with caution because of its potential impact to performance. The impact will be more significant for plans and packages that do many buffer updates to GBP-dependent pages, and not as noticeable for plans or packages that perform few buffer updates to GBP-dependent pages. The following options can be considered as alternatives to using IMMEDIATE(YES):

- Always run the dependent transaction on the same Db2 member as the originating transaction.
- Run the dependent transaction with ISOLATION(RR).
- Wait until the completion of phase two of commit before spawning the dependent transaction.
- CURRENTDATA(YES) or ISOLATION(RS) can be used to solve the problem only if the originating transaction updates columns that are not in the WHERE clause of the dependent transaction.

Defaults:

Process	Default value
BIND SERVICE	NO
BIND PLAN	NO
BIND PACKAGE	<ul style="list-style-type: none"> • For a local server: INHERITFROMPLAN • For a remote server: NO
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Process	Default value
REBIND TRIGGER PACKAGE	Existing value

ISOLATION bind option

The ISOLATION option determines how far to isolate an application from the effects of other running applications.

ISOLATION (CS)(RS)(RR)(UR)(NC)

On: BIND SERVICE, BIND and REBIND PLAN and PACKAGE, REBIND TRIGGER PACKAGE

Not valid for REBIND of a native SQL procedure package

(CS)

Cursor stability. Ensures, like repeatable read, that your application does not read a row that another process changes until that process releases that row. Unlike repeatable read, cursor stability does not prevent other applications from changing rows that your application reads before your program commits or terminates.

(RR)

Repeatable read. Ensures that:

- Your application does not read a row that another process has changed until that process releases that row.
- Other processes do not change a row that your application reads until your application commits or terminates.

(RS)

Read stability. Ensures that:

- Your application does not read a row that another process has changed until that process releases that row.
- Other processes do not change a row that satisfies the application's search condition until your application commits or terminates. It does allow other application processes to insert a row, or to change a row that did not originally satisfy the search condition.

If the server does not support RS, it uses RR.

(UR)

Uncommitted read. Unlike repeatable read and cursor stability, does not ensure anything. With the exception of LOB data, uncommitted read avoids acquiring locks on data and allows:

- Other processes change any row your application reads during the unit of work.
- Your application read any row that another process has changed, even if the process has not committed the row.

You can use this option only with a read-only operation: SELECT, SELECT INTO, or FETCH using a read-only cursor. If you specify ISOLATION(UR) for any other operation, Db2 uses ISOLATION(CS) for that operation.

(NC)

No commit. Used on packages that are bound to certain servers other than Db2 for z/OS. Db2 for z/OS does not support NC. If the server does not support this isolation level, it uses UR.

Defaults:

Process	Default value
BIND SERVICE	CS

Process	Default value
BIND PLAN	CS
BIND PACKAGE	<ul style="list-style-type: none"> • For a local server: The plan value • For a remote server: CS
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value. You cannot change ISOLATION from a specified value to a default of the plan value by using REBIND PACKAGE. To do that, you must use BIND PACKAGE ACTION(REPLACE).

Catalog record: Column ISOLATION of tables SYSPACKAGE and SYSPLAN.

Related tasks

[Choosing an ISOLATION option \(Db2 Performance\)](#)

KEEPDYNAMIC bind option

The KEEPDYNAMIC option determines whether Db2 keeps dynamic SQL statements after the point of commit or rollback..

KEEPDYNAMIC (NO)(YES)

On: BIND and REBIND PLAN and PACKAGE

Not valid for REBIND of a native SQL procedure package

Not valid for REBIND of a native REST service

(NO)

Specifies that Db2 does not keep dynamic SQL statements after the point of commit or rollback.

(YES)

Specifies that Db2 keeps dynamic SQL statements after the point of commit or rollback.

If you specify both KEEPDYNAMIC(NO) and RELEASE(DEALLOCATE), some dynamic SQL statements that reference declared temporary tables are held across commit points. See the description of the RELEASE(DEALLOCATE) option for more information.

If you specify KEEPDYNAMIC(YES), the application does not need to prepare an SQL statement after every commit or rollback point, Db2 keeps the dynamic SQL statement until one of the following events occurs:

- The application process ends.
- The application executes an explicit PREPARE statement with the same statement identifier.

If you specify KEEPDYNAMIC(YES), and the prepared statement cache is active, Db2 keeps a copy of the prepared statement in the cache. If the prepared statement cache is not active, Db2 keeps only the SQL statement string past the point of commit or rollback. Db2 then implicitly prepares the SQL statement if the application executes an OPEN, EXECUTE, or DESCRIBE operation for that statement.

If you specify KEEPDYNAMIC(YES), DDF server threads that are used to execute KEEPDYNAMIC(YES) packages will remain active. Active DDF server threads are subject to idle thread timeouts.

If you specify KEEPDYNAMIC(YES), you must not specify REOPT(ALWAYS). KEEPDYNAMIC(YES) and REOPT(ALWAYS) are mutually exclusive. However, you can use KEEPDYNAMIC(YES) with REOPT(ONCE).

Performance hint: KEEPDYNAMIC(YES) results in improved performance if your DRDA client application uses a cursor defined WITH HOLD. Db2 automatically closes a held cursor when there are no more rows to retrieve, which eliminates an extra network message.

Defaults:

Process	Default value
BIND PLAN	NO
BIND PACKAGE	NO
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column KEEP_DYNAMIC of table SYSPLAN and SYSPACKAGE.

[RELEASE bind option](#)

The RELEASE option determines when to release resources that a program uses, either at each commit point or when the program terminates.

LIBRARY bind option

The LIBRARY option determines what partitioned data set or zFS file path to search for the DBRM that is listed in the MEMBER option.

LIBRARY	(<i>dbrm-library-name</i>)	On: BIND PACKAGE
<i>dbrm-library-name</i> must be cataloged.		
<p>When <i>dbrm-library-name</i> is not delimited, it identifies a partitioned data set, and <i>dbrm-member-name</i> identifies the data set member. The partitioned data set name can be delimited by single quotation marks ('), and this is the recommended format. When a data set name is not delimited by single quotation marks, Db2 prefixes it with the user name or a default user name.</p> <p>When <i>dbrm-library-name</i> is delimited with double quotation marks ("), it identifies the absolute path of a zFS file, and <i>dbrm-member-name</i> identifies the zFS file. <i>dbrm-library-name</i> can contain mixed-case characters. For example, the following command binds a package from a DBRM file with absolute path name /u/mylib1/myMem1:</p>		
<pre>BIND PACKAGE (MYCOLL1) MEMBER("myMem1") LIBRARY("/u/mylib1")</pre>		

Defaults:

Process	Default value
BIND PLAN	N/A
BIND PACKAGE	Search only the libraries described by the DBRMLIB DD statement
REBIND PLAN	N/A
REBIND PACKAGE	N/A

Related concepts

MEMBER bind option

The MEMBER option determines what database request modules (DBRMs) to include in the package.

MEMBER	(<i>dbrm-member-name</i>)	On: BIND PACKAGE
--------	-----------------------------	------------------

The MEMBER option is deprecated for BIND PLAN. Use it only when you cannot run BIND PACKAGE to bind DBRMs into packages explicitly. When you specify MEMBER, Db2 binds the DBRMs into packages, and binds the packages to the specified plan.

dbrm-member-name

Specifies the name of a partitioned data set member or zFS file that contains a DBRM.

When the LIBRARY parameter is also specified, and *dbrm-library-name* is not delimited, LIBRARY identifies a partitioned data set, and *dbrm-member-name* identifies the data set member.

When the LIBRARY parameter is also specified, and *dbrm-library-name* is delimited with double quotation marks ("), LIBRARY identifies the absolute path of a zFS file, and *dbrm-member-name* identifies the zFS file. When *dbrm-member-name* is delimited with double quotation marks, it can contain mixed-case characters. For example, the following command binds a package from a DBRM file with absolute path name /u/mylib1/myMem1:

```
BIND PACKAGE (MYCOLL1) MEMBER("myMem1") LIBRARY("/u/mylib1")
```

Names beginning with DSN are reserved; you receive a warning message if *dbrm-member-name* begins with DSN.

dbrm-member-name becomes the package name.

For BIND PACKAGE, you can use only one member. If you do not use MEMBER, you must use COPY. You cannot use both options.

Defaults:

Process	Default value
BIND PLAN	N/A
BIND PACKAGE	None
REBIND PLAN	N/A
REBIND PACKAGE	N/A

Catalog record: Column NAME of table SYSPACKAGE.

NAME bind option

The NAME bind option specifies the name of the Db2 REST service to be bound or freed. The name is also used for the Db2 package that is associated with the REST service.

NAME	(<i>service-name</i>)	On: BIND SERVICE
------	-------------------------	------------------

service-name

The name of the REST service to be bound. There is no default. The *service-name* can be an undelimited or a delimited identifier. The delimiter for *service-name* is double quotation marks ("). If *service-name* is delimited, Db2 does not convert the value to uppercase.

Defaults:

Process	Default value
BIND SERVICE	N/A

Related tasks

[Creating a Db2 REST service \(Db2 REST services\)](#)

Related reference

[BIND SERVICE \(DSN\)](#)

The BIND SERVICE (DSN) subcommand builds an application package that represents a Db2 REST service. Db2 records the description of the service in the catalog tables and saves the prepared package in the directory.

[FREE SERVICE \(DSN\)](#)

The FREE SERVICE (DSN) subcommand deletes an application package that represents a Db2 REST service. The command also removes the corresponding entry from the catalog tables.

[BIND and REBIND options for packages, plans, and services](#)

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

OPTHINT bind option

The OPTHINT option controls whether access paths that are specified in PLAN_TABLE instances are used for static SQL statements.

OPTHINT	(' hint-id ')	On: BIND SERVICE, BIND and REBIND PLAN and PACKAGE
		Not valid for REBIND of a native SQL procedure package
		Not valid for REBIND of a native REST service

The OPTHINT option also sets the default value for special register CURRENT OPTIMIZATION HINT, which provides optimization hints for dynamic SQL.

(' hint-id ')

A character string of up to 128 characters in length. The value is used during query optimization to identify PLAN_TABLE rows that specify the use of a specific access path. The delimiters can only be single quotation marks (').

If ' hint-id ' contains all blank characters, Db2 does not use optimization hints for static SQL statements.

Db2 uses optimization hints only when optimization hints are enabled for your system. To enable optimization hints, specify YES for the value of the OPTHINTS subsystem parameter.

Restriction: The PACKAGE does not inherit from the PLAN.

Defaults:

Process	Default value
BIND SERVICE	All blanks, use normal optimization
BIND PLAN	All blanks, use normal optimization
BIND PACKAGE	All blanks, use normal optimization
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column OPTHINT of tables SYSPLAN and SYSPACKAGE.

Related tasks

[Specifying access paths in a PLAN_TABLE instance \(Db2 Performance\)](#)

[SYSPACKAGE catalog table \(Db2 SQL\)](#)

[SYSPLAN catalog table \(Db2 SQL\)](#)

OWNER bind option

The OWNER option determines the authorization ID of the owner of a plan or package.

OWNER	(<i>authorization-id</i>)	On: BIND SERVICE, BIND and REBIND PLAN and PACKAGE
		Not valid for REBIND of a native SQL procedure package or a function package

The owner must have the privileges required to execute the SQL statements contained in the object.

If ownership changes, all grants for privileges on the object that the previous owner issued change to name the new owner as the grantor. The new owner has the privileges BIND and EXECUTE on the object and grants them to the previous owner.

You can bind or rebind only the objects for which the authorization ID has bind privileges. If you do not specify an authorization ID, the process rebinds only the objects for which the primary ID has bind privileges.

Interactions with the PLANMGMT option: If you plan to change this option and the PLANMGMT option in a REBIND command, see [“PLANMGMT bind option” on page 127](#) for the implications.

OWNER for BIND and REBIND in trusted context: When BIND and REBIND commands are issued in a trusted context that has the ROLE AS OBJECT OWNER clause, the owner is determined as follows:

- If the OWNER option is not specified, the role associated with the binder becomes the owner.
- If the OWNER option is specified, the role specified in the OWNER option becomes the owner. In a trusted context, the OWNER specified must be a role. For the bind to succeed, the binder needs BINDAGENT privilege from the role specified in the OWNER option. The binder also receives BINDAGENT privilege, if the role associated with the binder has BINDAGENT privilege.

If the ROLE AS OBJECT OWNER clause is not in effect for the trusted context, then the current rules for BIND and REBIND ownership apply. If a role is associated in a trusted context, then the role privileges are included in the binder's privilege set to determine if the binder is allowed to perform the bind.

For remote BIND or REBIND PACKAGE only, the value of OWNER is subject to translation when sent to the remote system.

Defaults:

Process	Default value
BIND SERVICE	Primary authorization ID of the agent that runs the bind process
BIND PLAN	Primary authorization ID of the agent that runs the bind process
BIND PACKAGE	Primary authorization ID of the agent that runs the bind process
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column OWNER of table SYSPACKAGE, column GRANTOR of table SYSPACKAUTH, and column CREATOR of table SYSPLAN.

PACKAGE bind option

The PACKAGE option determines the packages to bind or rebind.

PACKAGE	(<i>location-name.collection-id</i>) (BIND PACKAGE) (<i>location-name.collection-id.package-id.(version-id)</i>) (REBIND PACKAGE)	On: BIND and REBIND PACKAGE
---------	---	------------------------------------

You cannot use the BIND PACKAGE subcommand to:

- Bind a package with the same name as an existing trigger package
- Copy a trigger package

The following options identify the location, collection, package name, and version of the package. You can identify a location and collection. For BIND, the DBRM supplies the package ID and version ID if you use the option MEMBER, or those IDs come from the option COPY. For REBIND, you must identify a package name, and you can also supply a version ID.

location-name

The location of the DBMS where the package binds or rebinds and where the description of the package resides. The location name must be defined in catalog table SYSIBM.LOCATIONS. If that table does not exist or if the DBMS is not in it, you receive an error message.

The default is the local DBMS.

collection-id or *

Specifies the collection to contain the package to bind, or that already contains the package to rebind. There is no default.

For REBIND, you can use an asterisk (*) to rebind all local packages with the specified *package-id* in all the collections for which you have bind privileges.

collection-id can be an undelimited or a delimited identifier. The delimiter for *collection-id* is double quotation marks ("). If *collection-id* is delimited, Db2 does not convert the value to uppercase.

package-id or * (For REBIND only)

Specifies the name of the package to rebind, as listed in column NAME of catalog table SYSPACKAGE. There is no default.

You can use an asterisk (*) to rebind all local packages in *collection-id* for which you have bind privileges.

For REBIND PACKAGE, *package-id* can be an undelimited or a delimited identifier. The delimiter for *package-id* is double quotation marks ("). If *package-id* is delimited, Db2 does not convert the value to uppercase.

version-id or * (For REBIND only)

Specifies the version of the package to rebind, as listed in column VERSION of catalog table SYSPACKAGE.

You can use an asterisk (*) to rebind all local versions of the specified *package-id* in *collection-id* for which you have bind privileges.

Using simply () rebinds the version of the package that is identified by the empty string.

If you omit *version-id*, the default depends on the how you specify *package-id*. If you use * for *package-id*, then *version-id* defaults to *. If you explicitly provide a value for *package-id*, then *version-id* defaults to the empty string version.

(*) (For REBIND only)

Rebinds all local Db2 packages for which the applicable authorization ID has the BIND privilege. Specifying (*) is the same as specifying the package name as (*.*) or (*.*). The applicable authorization ID is:

- The value of OWNER, if you use that option
- The primary authorization ID of the process running the bind, if you do not use the option OWNER

Catalog record: Columns COLLID, NAME, and VERSION of table SYSPACKAGE.

PATH bind option

The PATH option determines the SQL path that Db2 uses to resolve unqualified stored procedure names in CALL statements, in user-defined data types, and in functions.

PATH	(<i>schema-name</i>) (USER) (<i>schema-name</i> , USER , ...)	On: BIND SERVICE, BIND and REBIND PLAN and PACKAGE Not valid for REBIND of a native SQL procedure package
-------------	--	---

For the PATH option, consider the following guidelines when you specify a *schema-name*:

- The specified schema names are *not* folded to uppercase by Db2. This behavior is different than that for schema names in SQL statements, which are folded to uppercase before being stored in the catalog. If you do not specify these nondelimited schema names in upper case, Db2 cannot find a match in the catalog for those schema names.
- You can specify delimited identifiers in both mixed and uppercase characters.

The PATH keyword is mutually exclusive with the PATHDEFAULT keyword. Do not specify both keywords in the same REBIND command.

(*schema-name*)

Identifies a schema.

(*schema-name* , ...)

Identifies a list of schemas. The same schema name should not appear more than once in the SQL path.

The number of schemas that you can specify is limited by the length of the resulting SQL path, which cannot exceed 2048 bytes. To calculate the length of the resulting SQL path:

1. Take the length of each schema.
2. Add 2 for delimiters around each *schema-name* in the list.
3. Add 1 for each comma after each schema. Do **not** add 1 for the last schema.

USER

Represents a maximum 128-byte *schema-name* . At bind time, Db2 includes this 128-byte length in the total length of the list of schema names specified for the PATH bind option. The maximum length for a list of schema names, including comma separators, delimiters, and the 128-byte USER value, is 2048 bytes. If you exceed this limit, Db2 generates an error message at bind time.

At run time, Db2 substitutes the run time value of the USER special register, which contains the primary authorization ID of the run time process, for the *schema-name* in the position of USER in the PATH *schema-name* list.

If you specify USER in a list of schema names, do not use delimiters around the USER keyword.

Db2 does not validate that the specified schema actually exists at precompile or at bind time.

You do not need to explicitly specify the SYSIBM, SYSFUN, SYSPROC, and SYSIBMADM schemas; Db2 implicitly assumes that these schemas are at the beginning of the SQL path. Db2 adds these schemas in

the order listed. If you do not specify the SYSIBM, SYSFUN, and SYSPROC schemas, they are not included in the 2048-byte length.

SYSPUBLIC must not be specified for *schema-name*.

Interactions with the PLANMGMT option: If you plan to change this option and the PLANMGMT option in a REBIND command, see [“PLANMGMT bind option” on page 127](#) for the implications.

Defaults:

Process	Default value
BIND SERVICE	SYSIBM, SYSFUN, SYSPROC, SYSIBMADM, <i>service-qualifier</i>
BIND PLAN	SYSIBM, SYSFUN, SYSPROC, SYSIBMADM, <i>plan-qualifier</i>
BIND PACKAGE	SYSIBM, SYSFUN, SYSPROC, SYSIBMADM, <i>package-qualifier</i>
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column PATHSCHEMAS of table SYSPACKAGE.

The default values for BIND PLAN and BIND PACKAGE are not stored in the catalog. The default values in the catalog are a zero-length string.

Db2 for z/OS accepts FUNCPATH as a synonym for PATH when FUNCPATH is received from a remote requester. However, FUNCPATH cannot be specified on a BIND or REBIND command.

PATHDEFAULT bind option

The PATHDEFAULT option resets the PATH value for a package or plan to SYSIBM, SYSFUN, SYSPROC, SYSIBMADM, *plan qualifier*, or to SYSIBM, SYSFUN, SYSPROC, SYSIBMADM, *package qualifier*.

PATHDEFAULT

On: REBIND PLAN and PACKAGE

Not valid for REBIND of a native SQL procedure package

The PATHDEFAULT keyword is mutually exclusive with the PATH keyword. Do not specify both keywords in the same REBIND command.

Interactions with the PLANMGMT option: If you plan to change this option and the PLANMGMT option in a REBIND command, see [“PLANMGMT bind option” on page 127](#) for the implications.

Defaults:

Process	Default value
BIND PLAN	N/A
BIND PACKAGE	N/A
REBIND PLAN	None
REBIND PACKAGE	None

PKLIST and NOPKLIST bind options

The PKLIST option determines the packages to include in a package list. The NOPKLIST option deletes packages from a package list.

PKLIST NOPKLIST (*location-name.collection-id.package-id , ...*) PKLIST only

On: BIND and REBIND PLAN

For PKLIST, the order in which you list packages with partial identifiers determines the search order at run time and can affect performance.

NOPKLIST is used with REBIND PLAN only. NOPKLIST determines that the plan is rebound without a package list. If a package list already exists, NOPKLIST deletes it.

If you specify REBIND PLAN for a plan that was bound prior to DB2 10 and includes DBRMs, Db2 binds those existing DBRMs in the plan into packages. In this case, the PKLIST and NOPKLIST options have the following effects:

- If you specify PKLIST, the resulting plan includes both the newly created DBRM packages and the packages in the specified package list. The DBRM packages are included at the front of the newly created package list.
- If you specify NOPKLIST, any existing package lists are removed from the plan. NOPKLIST does not delete the package list that is created by binding the existing DBRMs into packages. However, if you use NOPKLIST a second time on the same plan that only contains package lists, all package lists are deleted.

location-name or *

Names the location of the DBMS where the package resides, or defers that choice until run time. Use either a particular location name or an asterisk (*), or omit this part of the identifier. The default is the local DBMS.

- If you use a particular location name, then that DBMS should be defined in catalog table SYSIBM.LOCATIONS. If that table does not exist or if the DBMS is not in it, you receive warning messages.
- If you use an asterisk, at run time the location comes from the special register CURRENT SERVER. Db2 checks privileges to use the SQL statements in the package at that location.

collection-id or *

Names the collection that contains the package or defers that choice until run time. Use either a particular collection ID or an asterisk (*). No default exists.

If you use an asterisk, then Db2 checks the privileges to use the SQL statements that are embedded in the package at run time. At that time also, Db2 determines the collection ID as follows:

- If the value in the special register CURRENT PACKAGESET is not blank, then that value is the collection ID.
- If the value of CURRENT PACKAGESET is blank, Db2 skips the entry unless it is the last entry in the package list. If it is the last or only entry, an error message is issued.

package-id or *

Names a particular package or specifies, by the asterisk, all packages in the collection. Because you cannot specify a *version-id* for the packages included in the package list, all versions are effectively included.

Defaults:

Process	Default value
BIND PLAN	None. You must specify PKLIST.
BIND PACKAGE	N/A
REBIND PLAN	Existing value
REBIND PACKAGE	N/A

Catalog record: Table SYSPACKLIST.

PLAN bind option

The PLAN option determines the plan or plans to bind or rebind.

PLAN	(<i>plan-name</i>) * (*) (REBIND PLAN only)	On: BIND and REBIND PLAN
-------------	---	---------------------------------

(*plan-name*)

Specifies the name of the application plan.

For REBIND only, the value of column NAME in the catalog table SYSPLAN; you can use a list of plan names.

(*) (For REBIND only)

Rebinds all plans for which the applicable authorization ID has the BIND privilege. The applicable ID is:

- The value of OWNER, if you use that option
- The authorization ID of the process running the bind, if you do not use the option OWNER

Catalog record: Column NAME of table SYSPLAN.

PLANMGMT bind option

The PLANMGMT option retains, during a rebind operation, all relevant package information (such as metadata, query text, dependencies, authorizations, and access paths) in catalog tables and in the directory.

PLANMGMT	(EXTENDED) (BASIC) (OFF)	On: REBIND PACKAGE and REBIND TRIGGER PACKAGE
-----------------	--------------------------------------	--

If performance regression occurs, you can direct Db2 to fall back to the older copy of a package. Over time, a package can have multiple copies that exist on disk storage, but only one of those copies is the active or current copy. All other copies are inactive.

([EXTENDED])

Discard the previous copy of a package. The current copy becomes the previous copy, and the original copy is managed as follows:

- If no original copy exists, the current copy is cloned to become the original.
- If an original copy exists, it is retained as the original.

In each case, the incoming copy of a package becomes the new current copy.

If the PLANMGMT option is specified explicitly and you change any of the following options, Db2 issues an error message:

- OWNER
- QUALIFIER
- ENABLE
- DISABLE
- PATH
- PATHDEFAULT
- IMMEDIATEWRITE
- BUSTIMESENSITIVE
- SYSTIMESENSITIVE
- ARCHIVESENSITIVE

([BASIC])

Discard the previous copy of a package. The current copy becomes the previous copy, and the incoming copy becomes the current copy. If an original copy of a package exists, it remains available.

If the PLANMGMT option is specified explicitly and you change any of the following options, Db2 issues an error message:

- OWNER
- QUALIFIER
- ENABLE
- DISABLE
- PATH
- PATHDEFAULT
- IMMEDIATEWRITE
- BUSTIMESENSITIVE
- SYSTIMESENSITIVE
- ARCHIVESENSITIVE

([OFF])

If none of the following options are changed, the current access path is removed and replaced with the incoming copy, and any previous or original copies are unaffected.

- OWNER
- QUALIFIER
- ENABLE
- DISABLE
- PATH
- PATHDEFAULT
- IMMEDIATEWRITE
- BUSTIMESENSITIVE
- SYSTIMESENSITIVE
- ARCHIVESENSITIVE

If any of the previously listed options are changed, all package copies (current, previous, and original) are purged.

Note: If the PLANMGMT setting is inherited from the value of the PLANMGMT subsystem parameter and the value of one of the previously listed options changes, Db2 internally turns off the PLANMGMT option. As a result, Db2 purges the prior copies of a package. However, if one of the previously listed options is specified but the value does not change, Db2 processes the command as if the option were not specified. If none of the previously listed options has a change in value, an error message is not issued, and the PLANMGMT option is not turned off.

Pattern-matching characters

PLANMGMT settings remain valid when pattern-matching characters (*) are used in the REBIND syntax. When you use REBIND PACKAGE to rebind more than one package, Db2 retains previous and original copies for each package separately.

Defaults

Process	Default value
BIND PLAN	N/A

Process	Default value
BIND PACKAGE	N/A
REBIND PLAN	N/A
REBIND PACKAGE	PLANMGMT subsystem parameter value
REBIND TRIGGER PACKAGE	PLANMGMT subsystem parameter value

Catalog record

See the PLANMGMT column of the SYSIBM.SYSPACKAGE and SYSIBM.SYSPACKCOPY catalog tables.

Related tasks

PROGAUTH bind option

The PROGAUTH option specifies whether Db2 performs program authorization checking to determine whether Db2 can execute a plan.

PROGAUTH	(<u>DISABLE</u>) (ENABLE)	On: BIND and REBIND PLAN
-----------------	----------------------------------	---------------------------------

(DISABLE)

Specifies that program authorization checking is not performed.

(ENABLE)

Specifies that program authorization checking is performed. That checking performs the following functions:

- Determines whether a program and plan combination is authorized to run.

If ENABLE is specified, a row must exist in table SYSIBM.DSNPROGAUTH for the plan that is specified in the BIND PLAN or REBIND PLAN statement. That row must also contain the name of a program that runs the plan. If the row is not correctly specified, Db2 returns a resource unavailable message when the program runs.

Defaults:

Process	Default value
BIND PLAN	DISABLE
BIND PACKAGE	N/A
REBIND PLAN	Existing value
REBIND PACKAGE	N/A

Catalog record: Column PROGAUTH of table SYSPLAN.

Related tasks

[Managing program authorization \(Managing Security\)](#)

Related reference

[SYSIBM.DSNPROGAUTH table \(Db2 SQL\)](#)

QUALIFIER bind option

The QUALIFIER option determines the implicit qualifier for unqualified names of tables, views, indexes, and aliases contained in the plan or package.

QUALIFIER	(<i>qualifier-name</i>)	On: BIND SERVICE, BIND and REBIND PLAN and PACKAGE
		Not valid for REBIND of a native SQL procedure package

(*qualifier-name*)

Specifies the value of the implicit qualifier. This value is not subject to translation when sent to a remote system for BIND or REBIND PACKAGE.

Interactions with the PLANMGMT option: If you plan to change this option and the PLANMGMT option in a REBIND command, see [“PLANMGMT bind option” on page 127](#) for the implications.

Defaults:

Process	Default value
BIND SERVICE	Authorization ID of the service owner
BIND PLAN	Authorization ID of the plan owner
BIND PACKAGE	Authorization ID of the package owner
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column QUALIFIER of tables SYSPACKAGE and SYSPLAN.

QUERYACCELERATION bind option

The QUERYACCELERATION bind option specifies whether a static SQL query is bound for acceleration, and if so, with what behavior. If the bind option is specified, it also provides the initial value for the CURRENT QUERY ACCELERATION special register that is used for dynamic queries, if a SET statement has not been issued for the special register.

When a package that is bound with this bind option runs, the QUERYACCELERATION value, instead of the QUERY_ACCELERATION subsystem parameter, provides the initial value for the CURRENT QUERY ACCELERATION special register. The CURRENT QUERY ACCELERATION special register specifies the acceleration behavior for dynamic SQL queries. Therefore, by rebinding the application package with the QUERYACCELERATION bind option, you can also accelerate dynamic SQL queries in an application. You can specify this bind option instead of either modifying the application to add an explicit SET CURRENT QUERY ACCELERATION statement or setting the QUERY_ACCELERATION subsystem parameter. For dynamic SQL queries in a package, the bind option value that you specify overrides the QUERY_ACCELERATION subsystem parameter. This bind option does not have a default value, so if you do not specify this bind option, the QUERY_ACCELERATION subsystem parameter initializes the special register.

Restriction: The QUERYACCELERATION bind option applies only to cursor queries, the SELECT portion of the SQL INSERT from SELECT statement, and static SQL SELECT INTO statements that are run locally. If a static SQL SELECT INTO statement is bound for acceleration but run remotely, Db2 fails the statement at run time and returns a negative SQL code.

QUERYACCELERATION	(NONE) (ENABLE) (ENABLEWITHFAILBACK) (ELIGIBLE) (ALL)	On: BIND PACKAGE, REBIND PACKAGE Not valid for REBIND of a native SQL procedure package
--------------------------	---	---

(NONE)

Specifies that no static SQL query in the application is bound for acceleration or will be accelerated when the application is run.

(ENABLE)

Specifies that a static SQL query is bound for acceleration if it satisfies the acceleration criteria, including the cost and heuristics criteria. The query is routed to an accelerator when the application runs. Otherwise, if the static query does not satisfy the acceleration criteria, the query is bound for execution in Db2.

If an error condition, such as one of the following examples, occurs while executing the accelerated static query when the application is run, Db2 fails the static query and returns a negative SQL code to the application:

- A failure occurs while running the static query on the accelerator.
- The accelerator returns an error for the query.
- The accelerator is not started and Db2 cannot route the static query to the accelerator for execution.

(ENABLEWITHFAILBACK)

Results in the same behavior as ENABLE, except if one of the error conditions occurs on the first OPEN of the accelerated static query when the application is run. In this case, instead of failing the static query and returning a negative SQL code to the application, Db2 performs a temporary *statement-level* incremental bind of the query and runs the query in Db2. The application does not see the acceleration failure. Failback to Db2 is not possible after the application does a successful OPEN for the query on the accelerator.

Restriction: [FL 504](#) If the query contains a passthrough-only expression, Db2 returns an error and does not accelerate the query, even if a matching user-defined function exists. For more information about passthrough-only expressions, see [Accelerating queries with passthrough-only expressions](#).

(ELIGIBLE)

Specifies that a static SQL query is bound for acceleration if the query meets the basic acceleration criteria, regardless of the cost or heuristics criteria. The query is routed to the accelerator when the application runs.

Like the behavior for ENABLE, if an error condition occurs while executing the accelerated static query when the application is run, Db2 fails the static query and returns a negative SQL code to the application.

(ALL)

Specifies that all of the static SQL queries in the application are to be bound for acceleration and routed to the accelerator when the application runs. If Db2 determines that a static query cannot be bound to run on the accelerator and the query references a user base table or view, the BIND or REBIND PACKAGE operation fails with an error message for that query. (A failure exception is made for declared global temporary tables (DGTs) and created global temporary tables (CGTs) because these tables cannot be accelerated.)

Like the behavior for ENABLE, if an error condition occurs while executing the accelerated static query when the application is run, Db2 fails the static query and returns a negative SQL code to the application.

The Db2 catalog table SYSIBM.SYSPACKSTMT has a STATUS column value of ' 0 ' for static SQL queries that have been bound for acceleration. For cursor-based static queries, the DECLARE CURSOR, OPEN, FETCH, and CLOSE statements each have a SYSPACKSTMT.STATUS column value of ' 0 '. For

a static INSERT from SELECT statement, where the SELECT has been bound for acceleration, the SYSPACKSTMT.STATUS column value is also '0'.

Defaults:

Process	Default value
BIND PACKAGE	None
REBIND PACKAGE	None

There is no default value for this bind option. The QUERYACCELERATION bind option does not inherit the setting from the QUERY_ACCELERATION subsystem parameter.

Related concepts

[How Db2 determines whether to accelerate eligible queries \(Db2 Performance\)](#)

Related tasks

[Enabling Db2 for IBM Db2 Analytics Accelerator for z/OS \(Db2 Performance\)](#)

QUERYID bind option

The QUERYID option frees entries in the SYSIBM.SYSQUERY table, and the SYSIBM.SYSQUERYPLAN table or the SYSIBM.SYSQUERYOPTS table.

QUERYID	(<i>number</i>) (ALL)	On: FREE QUERY
----------------	------------------------------	-----------------------

number

Frees an entry in the SYSIBM.SYSQUERY table that has the same QUERYID value, and the corresponding entries in the SYSIBM.SYSQUERYPLAN table or the SYSIBM.SYSQUERYOPTS table.

ALL

Frees all the entries from the SYSIBM.SYSQUERY table and the corresponding entries from the SYSIBM.SYSQUERYPLAN table or the SYSIBM.SYSQUERYOPTS table.

RELEASE bind option

The RELEASE option determines when to release resources that a program uses, either at each commit point or when the program terminates.

RELEASE	(<u>COMMIT</u>) (DEALLOCATE) (INHERITFROMPLAN) (Not valid for REBIND of a native REST service)	On: BIND SERVICE (COMMIT DEALLOCATE), BIND and REBIND PLAN and PACKAGE, REBIND TRIGGER PACKAGE Not valid for REBIND of a native SQL procedure package
----------------	--	---

Partition locks follow the same rules as table space locks, and all partitions are held for the same duration. Thus, if one package is using RELEASE(COMMIT) and another is using RELEASE(DEALLOCATE), all partitions use RELEASE(DEALLOCATE).

The RELEASE option does not affect page, row, LOB or XML locks.

(COMMIT)

Releases resources at each commit point, unless cursors are held. If the application accesses the object again, it must acquire the lock again.

- All tables and table spaces are unlocked when:

TSO, Batch, and CAF

An SQL COMMIT or ROLLBACK statement is issued, or your application process terminates

IMS

A CHKP or SYNC call (for single-mode transactions), a GU call to the I/O PCB, or a ROLL or ROLB call is completed

CICS

A SYNCPOINT command is issued.

Exception:

If the cursor is defined WITH HOLD, table or table space locks necessary to maintain cursor position are held past the commit point.

- Table, partition, or table space locks are released at the next commit point unless the cursor is defined WITH HOLD.
- The least restrictive lock needed to execute each SQL statement is used except when a more restrictive lock remains from a previous statement. In that case, that lock is used without change.

DEALLOCATE

Releases resources only when the thread terminates.

When you specify RELEASE(DEALLOCATE), some static and dynamic statements that reference declared temporary tables are also kept as prepared across commit points unless the table was defined with the ON COMMIT DROP TABLE option. These statements that are kept as prepared across commit points are INSERT, UPDATE, DELETE, MERGE, and SELECT INTO statements. The statement is not kept across the commit point if one of the following conditions is true:

- The declared global temporary table is defined with the ON COMMIT DROP TABLE option.
- The statement also references a Db2 base object (for example, a table or view), and one of the following statements is true:
 - The base object reference is for a Db2 catalog table.
 - At the commit point, Db2 determines that another Db2 thread is waiting for an X-lock on the base object's database descriptor (DBD).
 - The statement references an XML function or operation, and at the commit point Db2 determines that the base object DBD S-lock for the XML operation must be released.
 - At the commit point, Db2 determines that a base object DBD S-lock that is used by the statement must be released and cannot be maintained across the commit point.
- Db2 determines that another Db2 thread is waiting for an X-lock on the Db2 package that contains the statement.

RELEASE(DEALLOCATE) has no effect on most dynamic SQL statements, which use RELEASE(COMMIT), except in the following cases:

- When you use RELEASE(DEALLOCATE) and KEEPYNAMIC(YES), and your subsystem is installed with the CACHEDYN subsystem parameter set to YES, the RELEASE(DEALLOCATE) option is honored for dynamic SELECT, INSERT, UPDATE, and DELETE statements.
- When you use RELEASE(DEALLOCATE), prepared INSERT, UPDATE, DELETE, and MERGE dynamic statements that reference declared temporary tables are kept past commit points unless the table was defined with the ON COMMIT DROP TABLE option.

If a lock is to be held past commit and it is an S, SIX, or X lock on a table space or a table in a segmented table space, Db2 sometimes demotes that lock to an intent lock (IX or IS) at commit. Db2 demotes a gross lock if it was acquired for one of the following reasons:

- Db2 acquired the gross lock because of lock escalation.
- The application issued a mass delete (DELETE FROM *object* without a WHERE clause or TRUNCATE).

Packages that are executed on a Db2 server through a DRDA connection with a client system honor the RELEASE(DEALLOCATE) bind option. However, if the MODIFY DDF PKGREL(COMMIT) command

has been issued at a Db2 server, the RELEASE(DEALLOCATE) option has no effect on packages that are executed on that server through a DRDA connection with a client system.

Locks that are acquired for dynamic statements are held until one of the following events occurs:

- The application process ends (deallocation).
- The application issues a PREPARE statement with the same statement identifier. (Locks are released at the next commit point.)
- The statement is removed from the cache because it has not been used. (Locks are released at the next commit point.)
- An object that the statement is dependent on is dropped or altered, or a privilege that the statement needs is revoked. (Locks are released at the next commit point.)

RELEASE(DEALLOCATE) can increase the package or plan size, because additional items become resident in the package or plan.

INHERITFROMPLAN

Enables a local package to inherit the value of the RELEASE option from the plan, regardless of whether the package was bound remotely or locally.

If you bind a package remotely with the RELEASE(INHERITFROMPLAN) option and the remote server does not understand the INHERITFROMPLAN value, the server might return an error.

The RELEASE(INHERITFROMPLAN) value is not applied in the following situations, because no associated plan exists:

- If you bind the application locally and then copy the package to a remote server.
- If you bind an application that uses RRSAF.
- For any packages that are created for utilities

In these cases, RELEASE(COMMIT) is in effect for the package.

Defaults:

Process	Default value
BIND SERVICE	COMMIT
BIND PLAN	COMMIT
BIND PACKAGE	<ul style="list-style-type: none">• For a local server: Plan value• For a remote server: COMMIT
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value
REBIND TRIGGER PACKAGE	Existing value

Catalog record: Column RELEASE of tables SYSPACKAGE and SYSPLAN.

Related tasks

[Choosing a RELEASE option \(Db2 Performance\)](#)

Related reference

[KEEPDYNAMIC bind option](#)

The KEEP DYNAMIC option determines whether Db2 keeps dynamic SQL statements after the point of commit or rollback..

REOPT bind option

The REOPT option specifies whether Db2 determines an access path at run time by using the values of host variables, parameter markers, and special registers.

REOPT	(NONE) (ALWAYS) (ONCE) (AUTO)	On: BIND SERVICE, BIND and REBIND PLAN and PACKAGE Not valid for REBIND of a native SQL procedure package
--------------	--	---

For dynamic statements, the REOPT bind option also controls whether Db2 considers the literal values for access path selection when CONCENTRATE STATEMENTS WITH LITERALS is specified when statements are prepared. The literal values are considered only when REOPT(ONCE) or REOPT(AUTO) is specified.

(NONE)

Does not determine an access path at run time. You can use NOREOPT(VARS) as a synonym for REOPT(NONE).

(ALWAYS)

Determines the access path again at run time each time the statement is run. Db2 determines access paths at both bind time and run time for statements that contain one or more of the following variables:

- Host variables
- Parameter markers
- Special registers

At run time, Db2 uses the values in those variables to determine the access paths. You can use REOPT(VARS) as a synonym for REOPT(ALWAYS).

(ONCE)

Determines the access path for any dynamic statement only once, at the first run time or at the first time the statement is opened. This access path is used until the prepared statement is invalidated or removed from the dynamic statement cache and needs to be prepared again.

(AUTO)

Autonomically determines if a new access path needs to be generated to further optimize the performance for each execution. Db2 determines the access path at the first run time and then at each subsequent execution, Db2 evaluates whether a new access path is needed. If so, Db2 generates a new access path and uses that access path until another new access path is generated. For cached dynamic statements that reference parameter markers, a new path can be generated at any execution. The new path is based on changes to estimated filter factors for predicates that result from changes to parameter marker values.

Usage notes:

If you specify the bind option REOPT(ALWAYS), REOPT(AUTO), or REOPT(ONCE), Db2 sets the bind option DEFER(PREPARE) automatically. However, when you specify REOPT(ONCE), Db2 determines the access path for a statement only once (at the first run time).

You cannot use REOPT(ALWAYS) with the KEEP DYNAMIC(YES) option.

The following restrictions apply to REOPT(ONCE):

- REOPT(ONCE) is ignored if you use it with static SQL statements because Db2 for z/OS caches only dynamic statements.
- If a dynamic statement in a plan or package that is bound with REOPT(ONCE) runs when dynamic statement caching is turned off, the statement runs as if REOPT(ONCE) is not specified.

- You **cannot** use both REOPT(ONCE) and NODEFER(PREPARE).
- You **can** use both REOPT(ONCE) and KEEPYNAMIC(YES).

Defaults:

Process	Default value
BIND SERVICE	NONE
BIND PLAN	NONE
BIND PACKAGE	NONE
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column REOPTVAR of the SYSPLAN and SYSPACKAGE catalog tables.

RESTSERVICEDEFAULT bind option

The RESTSERVICEDEFAULT bind option determines whether the specified REST service package version identified by the PACKAGE option will be modified to be the default service version for the service.

This option can only be used when rebinding a local REST service package and is invalid when used for any other package type.

RESTSERVICEDEF AULT	(YES)	On: REBIND PACKAGE
		Only valid for REBIND of a REST service package.

(YES)

Specifies that the REST service package version identified by the PACKAGE option will be modified to become the active REST service default service version. This option value can only be used when rebinding a versioned REST service package on the local Db2system. The REST service package being rebound, as specified by the PACKAGE bind option, must specify a valid, non-empty string *version-id*. Additionally, the RESTSERVICEDEFAULT option can only be used to modify a REST service package on the local Db2 subsytem. If a *location-name* is specified in the PACKAGE bind option, the *location-name* must be the location name of the local Db2 system. If the RESTSERVICEDEFAULT bind option is specified and the package being rebound is not a local, versioned REST service package, Db2 will issue an error message.

Usage notes:

The RESTSERVICEDEFAULT option is not allowed when using an asterisk (*) wilddcarding for any portion of the package name values used in the PACKAGE option.

There is no validation of the REST service compatibility when changing the default service versioning. The Db2 REST service versioning support allows each version of a REST service to be created using a different SQL statement with different input and output parameters and different bind options. This means that your REST client applications may require code changes to be compatible with a new default version of a REST service. Db2does not check or validate REST service version compatibility when changing the default service version. It is recommended that you compare the JSON request and response schemas

between the current and new default REST service version to determine if there are any incompatible differences before changing the default service version of a REST service. The [REST service discover API](#) can be used to obtain the REST service JSON request and response schemas for review. You should also review any REST client applications that are using the default service version URI (`/services/<collection id>/<service name>`) to ensure that they are compatible before changing the default service version of a REST service.

Examples:

Rebind the existing local REST service package `MyServices.createCustomer.(v2)` to be the default service version for the `MyServices.createCustomer` REST service.

```
REBIND PACKAGE("MyServices"."createCustomer".(v2)) RESTSERVICEDEFAULT (YES)
```

Rebind the existing local REST service package `payroll.getEmployee.(v3)`, which is located at the local location `STLEC1`, to be the default service version for the `payroll.getEmployee` REST service.

```
REBIND PACKAGE(STLEC1."payroll"."getEmployee".(v3)) RESTSERVICEDEFAULT (YES)
```

Defaults:

Process	Default value
REBIND Package	None (No change to the REST service default service version)

Catalog record: `ISDEFAULT` column of the `SYSIBM.DSNSERVICE` catalog table.

ROUNDING bind option

The `ROUNDING` option specifies the rounding mode at bind time. Use rounding mode to manipulate `DECFLOAT` data.

ROUNDING	(CEILING) (DOWN) (FLOOR) (HALFDOWN) (HALFEVEN) (HALFUP) (UP)	On: BIND SERVICE, BIND and REBIND PLAN and PACKAGE Not valid for REBIND of a native SQL procedure package
-----------------	--	---

CEILING

Round toward +infinity. If all of the discarded digits are zero or if the sign is negative the result is unchanged other than the removal of discarded digits. Otherwise, the result coefficient should be incremented by 1 (round up).

DOWN

Round toward 0 (TRUNCATION). The discarded digits are ignored.

FLOOR

Round toward -infinity. If all of the discarded digits are zero or if the sign is positive the result is unchanged other than the removal of discarded digits. Otherwise, the sign is negative and the result coefficient should be incremented by 1.

HALFDOWN

Round to the nearest; if equidistant, round down. If the discarded digits represent greater than half (0.5) of the value of a one in the next left position then the result coefficient should be incremented by 1 (rounded up). Otherwise, (the discarded digits are 0.5) or less) the discarded digits are ignored.

HALFEVEN

Round to the nearest; if equidistant, round so that the final digit is even. If the discarded digits represent greater than half (0.5) the value of a one in the next left position then the result coefficient

should be incremented by 1 (rounded up). If they represent less than half, then the result coefficient is not adjusted (that is, the discarded digits are ignored). Otherwise, (they represent exactly half) the result coefficient is unaltered if its rightmost digit is even, or incremented by 1 (rounded up) if its rightmost digit is odd (to make an even digit).

This option is the default.

HALFUP

Round to nearest; if equidistant, round up. If the discarded digits represent greater than or equal to half (0.5) of the value of a one in the next left position then the result coefficient should be incremented by 1 (rounded up). Otherwise, the discarded digits are ignored.

UP

Round away from 0. If all the discarded digits are zero the result is unchanged other than they removal of discarded digits. Otherwise, the result coefficient should be incremented by 1 (rounded up).

The default value of ROUNDING option is DEF DECFLOAT ROUNDING MODE from application defaults load module.

Defaults:

Process	Default value
BIND SERVICE	HALFEVEN
BIND PLAN	HALFEVEN
BIND PACKAGE	HALFEVEN
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column ROUNDING of tables SYSPACKAGE and SYSPLAN, and column ROUNDING_MODE of table SYSENVIRONMENT.

SQLDDNAME bind option

The SQLDDNAME bind option specifies the name of a JCL DD statement. The DD statement specifies the file or data set that contains a single SQL statement to be included in a Db2 REST service.

SQLDDNAME	(<i>ddname</i>)	On: BIND SERVICE
------------------	-------------------	-------------------------

ddname

The name of a JCL DD statement. The DD statement specifies the file or data set that contains a single SQL statement to be included in a REST service. If the SQLDDNAME parameter is not provided, DSNSTMT is used as the default name.

The JCL for the BIND SERVICE subcommand must provide a valid DD specification for *ddname*. The DSNNAME parameter of the DD specification must be either a valid DSORG=PS data set or a member-qualified library, such as `library.name(member)`. If the SQL statement text is provided via a zFS or UNIX file, the PATH parameter, which is mutually exclusive with the DSNNAME parameter, must specify a fully qualified name to the zFS or UNIX file.

Db2 opens and reads the data set or file referenced by the DD specification for input only. The maximum amount of data read is 2097152 bytes. The organization of the data set or file must be sequential. Db2 also checks the data set or file to determine if it has a valid record format (RECFM). A valid RECFM is F (fixed-length records, unblocked), FB (fixed-length records, blocked), V (variable-length records, unblocked), or VB (variable-length records, blocked).

zFS or UNIX files are normally not defined with RECFM. Make sure that you specify RECFM=VB in the DD statement when it refers to a zFS or UNIX file as shown in the following example:

```
//DSNSTMT DD PATH='/file_path',  
// PATHOPTS=ORDONLY,  
// RECFM=VB,LRECL=32756,BLKSIZE=32760
```

If the DD specification refers to a temporary data set created within the job, make sure that you specify the DCB parameter with all the options, including RECFM, as in DCB=(RECFM=[V|VB|F|FB],LRECL=*nnnnn*,BLKSIZE=*mmmmm*).

Defaults:

Process	Default value
BIND SERVICE	DSNSTMT

BIND and REBIND options for packages, plans, and services

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

SQLERROR bind option

The SQLERROR option determines whether to create a package if SQL errors occur.

SQLERROR	(NOPACKAGE) (CONTINUE) (CHECK)	On: BIND SERVICE(NOPACKAGE only), BIND PACKAGE
-----------------	--------------------------------------	---

(NOPACKAGE)

Creates no package if an error occurs.

(CONTINUE)

Creates a package, even if errors occur when binding SQL statements. The statements in error cannot execute. Any attempt to execute them at run time causes errors.

(CHECK)

Performs all syntax and semantic checks on the SQL statements being bound when the authorization ID for BIND does not have the privilege to execute the statements. A package is not created as part of this process. If an existing package with the same name and version is encountered during bind processing, the existing package is not dropped or replaced, even if ACTION(REPLACE) was specified.

Defaults:

Process	Default value
BIND PLAN	N/A
BIND PACKAGE	NOPACKAGE
BIND SERVICE	NOPACKAGE
REBIND PLAN	N/A
REBIND PACKAGE	N/A. Because you cannot use the option SQLERROR for REBIND PACKAGE, the value for the previous package remains in effect when you rebind that package. If you rebind a package that uses SQLERROR(CONTINUE), SQL statements that were in error at BIND time are not rebound.

Catalog record: Column SQLERROR of table SYSPACKAGE.

SQLRULES bind option

The SQLRULES option determines whether you can execute a type 2 CONNECT statement to an existing SQL connection, according to Db2 rules.

SQLRULES	(DB2) (STD)	On: BIND and REBIND PLAN
-----------------	--------------------	---------------------------------

Alternatively, the statement causes an error, according to the ANSI/ISO SQL standard of 1992. This option applies to any application process that uses the plan and executes type 2 CONNECT statements. It has no effect on type 1 CONNECT statements.

(DB2)

No error occurs if CONNECT identifies an existing SQL connection. If X is an existing SQL connection, CONNECT TO X makes X the current connection. If X is already the current connection, CONNECT TO X has no effect on the state of any connections.

(STD)

An error occurs if CONNECT identifies an existing SQL connection. Therefore, if X is a dormant SQL connection, you must use the SQL statement SET CONNECTION to make X the current connection.

For local operations, the value of SQLRULES is used for the initial value of the SQL special register CURRENT RULES.

Defaults:

Process	Default value
BIND PLAN	Db2
BIND PACKAGE	N/A
REBIND PLAN	Existing value
REBIND PACKAGE	N/A

Catalog record: Column SQLRULES of table SYSPLAN.

STRDEL bind option

The STRDEL bind option designates whether an apostrophe (') or double quotation marks (") is used as the string delimiter within SQL statements. If a value is not specified, Db2 uses the value specified in the SQL STRING DELIMITER field on panel DSNTIPF.

STRDEL	(APOSTROPHE) (QUOTE)	On: BIND SERVICE
---------------	-----------------------------	-------------------------

APOSTROPHE

Use an apostrophe (') as the string delimiter.

QUOTE

Use double quotation marks (") as the string delimiter.

Defaults:

Process	Default value
BIND SERVICE	The value specified in the SQL STRING DELIMITER field of the DSNTIPF subsystem parameter

The FREE SERVICE (DSN) subcommand deletes an application package that represents a Db2 REST service. The command also removes the corresponding entry from the catalog tables.

[BIND and REBIND options for packages, plans, and services](#)

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

SWITCH bind option

The SWITCH option causes the previous copy or original copy of a package to become the current copy of the package.

SWITCH ([PREVIOUS])(ORIGINAL)

On: REBIND PACKAGE and REBIND TRIGGER PACKAGE

Not valid for REBIND of a native REST service

This option allows you to revert to an older copy of a package in the event of a performance regression. You cannot specify SWITCH with any other rebind options. If the package that you specify does not have the previous or original copy to switch to, Db2 issues an error message, and continues processing the rest of the list. Use this option with the pattern-matching character (*) in the syntax.

If the target package copy is not valid or it was bound in a release prior to DB2 10, the command fails and Db2 issues an error message.

([PREVIOUS])

Switches between the current and previous copies of a package or a plan. The current copy takes the place of the previous copy, and the previous copy takes the place of the current copy.

(ORIGINAL)

Moves the current copy to take the place of the previous copy. Any previous copy that exists is purged. The original copy is cloned to take the place of the current copy.

Defaults:

Process	Default value
BIND PLAN	N/A
BIND PACKAGE	N/A
REBIND PLAN	N/A
REBIND PACKAGE	Existing value
REBIND TRIGGER PACKAGE	Existing value

SYSTIMESENSITIVE bind option

The SYSTIMESENSITIVE option specifies whether references to system-period temporal tables in both static and dynamic SQL statements are affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.

SYSTIMESENSITIVE	(YES) (NO)	On: BIND SERVICE, BIND PACKAGE, REBIND PACKAGE, and REBIND TRIGGER PACKAGE Not valid for REBIND of a package for a native SQL procedure, compiled SQL function, or advanced trigger
-------------------------	-------------------	---

- (YES)**
References to system-period temporal tables are affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.
- (NO)**
References to system-period temporal tables are not affected by the value of the CURRENT TEMPORAL SYSTEM_TIME special register.

Interactions with the PLANMGMT option: If you plan to change this option and the PLANMGMT option in a REBIND command, see [“PLANMGMT bind option” on page 127](#) for the implications.

Defaults:

Process	Default value
BIND SERVICE	YES
BIND PLAN	N/A
BIND PACKAGE	YES
REBIND PLAN	N/A
REBIND PACKAGE	Existing value
REBIND TRIGGER PACKAGE	Existing value

Related reference

[CURRENT TEMPORAL SYSTEM_TIME \(Db2 SQL\)](#)

TIME bind option

The TIME bind option specifies the format of time output that Db2 returns. If a value is not specified, Db2 uses the value specified in the TIME FORMAT field on panel DSNTIP4.

TIME	(EUR) (ISO) (JIS) (LOCAL) (USA)	On: BIND SERVICE
-------------	---	-------------------------

- EUR**
Use the time format of the IBM standard for Europe.
- ISO**
Use the time format of the International Standards Organization.

JIS

Use the time format of the Japanese Industrial Standard.

LOCAL

Use the same time format as specified for the ISO value

USA

Use the time format of the IBM standard for the United States of America.

Defaults:

Process	Default value
BIND SERVICE	The value specified in the TIME FORMAT field of the DSNTIP4 subsystem parameter

Related tasks

[FREE SERVICE \(DSN\)](#)

The FREE SERVICE (DSN) subcommand deletes an application package that represents a Db2 REST service. The command also removes the corresponding entry from the catalog tables.

[BIND and REBIND options for packages, plans, and services](#)

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

VALIDATE bind option

The VALIDATE option determines whether to recheck, at run time, errors of the types "OBJECT NOT FOUND" and "NOT AUTHORIZED" that are found during bind or rebind.

VALIDATE	(RUN) (BIND)	On: BIND SERVICE, BIND and REBIND PLAN and PACKAGE
		Not valid for REBIND of a native SQL procedure package

The option has no effect if all objects and needed privileges exist.

(RUN)

Indicates that if not all objects or privileges exist at bind time, the process issues warning messages, but the bind succeeds. Db2 checks existence and authorization again at run time for SQL statements that failed those checks during bind. The checks use the authorization ID of the plan or package owner.

If you specify the VALIDATE(RUN) bind option, and the application to be bound contains an error with a SET host-variable assignment statement, the bind process still issues only warning messages, not error messages.

(BIND)

Indicates that if not all objects or needed privileges exist at bind time, the process issues error messages, and does not bind or rebind the plan or package, *except that*:

For BIND PACKAGE only, if you use the option SQLERROR(CONTINUE), the bind succeeds, but the SQL statements in it that have errors cannot execute.

With VALIDATE(BIND), Db2 does not check authorization for the LOCK TABLE statement and some CREATE, ALTER, and DROP statements until run time.

Defaults:

Process	Default value
BIND SERVICE	RUN
BIND PLAN	RUN
BIND PACKAGE	RUN
REBIND PLAN	Existing value
REBIND PACKAGE	Existing value

Catalog record: Column VALIDATE of tables SYSPACKAGE and SYSPLAN.

VERSION bind option

The VERSION bind option defines the version identifier of the Db2 REST service. The VERSION bind option is only valid after REST service versioning support has been enabled.

VERSION	(<i>version-id</i>)	On: BIND SERVICE
----------------	-----------------------	-------------------------

version-id

Defines the version identifier of the Db2 REST service. A version identifier is an SQL identifier of up to 64 characters, each of which is an uppercase letter, lowercase letter, numerals (0-9), the underscore (_) character, the dash (-) character, the period (.) character, the at sign (@) character, the pound sign (#) character, or the dollar sign (\$) character.

If you do not specify a version, the default version identifier used is determined based on whether REST service versioning support has been enabled or not. If REST service versioning support has been enabled, then "V1" is used as the default, otherwise, the empty string is used.

Defaults:

Process	Default value
BIND SERVICE	V1 if REST service versioning is enabled, otherwise, empty string.

Chapter 15. Specification of Db2 for z/OS bind options from IBM Data Server clients and drivers

When you bind packages on Db2 for z/OS data servers from IBM Data Server clients and drivers, you need to specify bind options that are supported by Db2 for z/OS but not by Db2 for Linux®, UNIX, and Windows as generic bind options.

You can use the following IBM Data Server client and driver interfaces to specify Db2 for z/OS-only bind options:

- For Java™ clients, when you use IBM Data Server Driver for JDBC and SQLJ utility DB2Binder or method `DB2Binder.runJDBCBinder` to bind IBM Data Server Driver for JDBC and SQLJ packages or rebind user packages, specify the Db2 for z/OS bind options as sub-options of the `-bindOptions` parameter. For example:

```
java com.ibm.db2.jcc.DB2Binder -url jdbc:db2://srv1.svl.ibm.com:446/DB1
-user myid -password mypass -action replace
-bindOptions "IMMEDWRITE YES"
```

- For non-Java clients, when you use CLI method `SQLCreatePkg` to bind packages, specify the Db2 for z/OS bind options as sub-options of the `GENERIC` option in the `szBindOpts` string. For example:

```
strcpy (bindFileName, "/u/user1/sqllib/bnd/@all.lst");
cliRC = SQLCreatePkg(hdbc,
                    bindFileName,
                    strlen(bindFileName),
                    "GENERIC=IMMEDWRITE NO"
                    -3, // SQL_NTS);
```

You can specify the following Db2 for z/OS bind options as generic bind options:

- APCOMPARE
- APRETAINDUP
- APREUSE
- APPLCOMPAT
- ARCHIVESENSITIVE
- BUSTIMESENSITIVE
- CONCURRENTACCESSRESOLUTION
- DBPROTOCOL
- DEFER(PREPARE) or NODEFER(PREPARE)
- EXPLAIN
- EXTENDEDINDICATOR
- IMMEDWRITE
- OPTHINT
- PATHDEFAULT (rebind only)
- PLANMGMT (rebind only)
- REOPT
- ROUNDING
- SWITCH (rebind only)
- SYSTIMESENSITIVE

Chapter 16. -CANCEL THREAD (Db2)

The Db2 command **CANCEL THREAD** cancels processing for specific local or distributed threads.

Abbreviation: -CAN THD

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or a CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, if you do not specify the LOCAL option, you must use a privilege set of the process that includes one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

If you specify the LOCAL option, no authorization is needed.

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

THREAD (token)

Identifies a specific thread, either distributed or not, whose processing you want to cancel. Db2 assigns a token to each thread that is unique for that Db2 subsystem, but not necessarily unique across subsystems.

The token is a one- to six-digit decimal number. You can determine what the token is by issuing the Db2 command **DISPLAY THREAD** or by using an IFI **READS** call for IFCID 0147 or 0148. The token can also appear after the equal sign in Db2 messages that display an LUWID. If the token is 0, the thread of that token cannot be canceled.

DDF THREAD

Identifies distributed threads for which you want to cancel processing.

(luwid)

A logical unit of work identifier (LUWID), consisting of:

- A fully qualified LU network name, which consists of:
 - A one- to eight-character network ID

- A period
- A one- to eight-character network LU name
- An LUW instance number, which consists of 12 hexadecimal characters that uniquely identify the unit of work

If you enter three fields separated by periods, Db2 assumes that you are entering an LUWID.

Two or more distributed threads might have the same LUWID. For example, for package-based continuous block fetch, the requester opens a secondary connection for each statement in an application. At the server, all database access threads that process work for those secondary connections have the same LUWID. All distributed threads with the same LUWID are canceled.

The LUWID can be determined from the Db2 DISPLAY THREAD command and other Db2 messages.

(token)

See THREAD (*token*).

DUMP

Specifies that a dump is generated when CANCEL THREAD is issued, and the thread is active in Db2. The dump can be used for diagnostic purposes.

When you cancel a thread that is not currently active in Db2, Db2 performs a hard cancel and no dump is provided. A thread is considered to be not currently active in Db2 when it has left Db2 to perform application work.

LOCAL

Specifies that Db2 search the home address space of the allied agent for a thread that matches *token*. If Db2 finds a thread, it performs a soft cancel on that thread. The LOCAL option applies only to a CANCEL THREAD command that is issued through the IFI interface. The IFI application must run in the same address space as the thread that needs to be canceled, and the thread must be connected to Db2 through the RRS attachment facility.

NOBACKOUT

Specifies that Db2 is not to attempt to back out the data during transaction rollback processing. Canceling the thread with NOBACKOUT leaves objects in an inconsistent state. Do not issue this command with NOBACKOUT unless you have a plan to resolve the data inconsistency.

Multiple NOBACKOUT requests are allowed. However, if the thread is active and the request is accepted, subsequent requests are ignored. You can choose to issue a subsequent request if a request fails (as indicated by message DSNIO32I). Objects that the thread modifies are recovered (backed out). If back out processing fails, the objects are marked REFRESH PENDING (REFP) and either RECOVER PENDING (RECP) or REBUILD PENDING (RBDP or PSRBD) in the database exception table. Resolve the REFP status of the object by running the RECOVER utility to recover the object to a prior point in time or by running LOAD REPLACE on the object.

FORCE

Attempts to purge the thread of a remote connection in the Db2 server. The FORCE option will be accepted only after a request to CANCEL THREAD is issued without the FORCE option.

Attention: The FORCE option can potentially affect the Db2 subsystem. Use it to cancel threads that impact the Db2 subsystem and cannot be canceled without FORCE.

Usage notes

Canceling local threads:

The CANCEL command schedules a thread to terminate. Threads that are not in Db2 terminate immediately.

Canceling Db2 threads before canceling jobs or purging transactions:

If you need to cancel or purge jobs or transactions with active Db2 threads, the best practice is to issue the Db2 CANCEL THREAD command before you cancel or purge the tasks. When the

CANCEL THREAD command is issued, Db2 abnormally terminates (abends) the threads at predictable locations in Db2. This process results in orderly termination of the tasks.

Canceling threads on applications that update NOT LOGGED tables spaces:

Take care when you issue a CANCEL command for an application that updates a NOT LOGGED table space. The CANCEL THREAD command can cause the NOT LOGGED table space to be placed in the LPL, so that the table space must be recovered.

Canceling distributed threads:

Canceling a distributed thread can cause the thread to enter the indoubt state. Message DSNL450I is issued if the CANCEL command causes the DDF thread to be converted from active to indoubt. Db2 releases the resources that the thread holds when the indoubt state is resolved by automatic indoubt resolution with the coordinator, or by resolution with the command RECOVER INDOUBT.

If a thread that is specified in the command is part of a global transaction, the command is executed against all threads in the global transaction.

The CANCEL command schedules a thread to be terminated in Db2. To terminate, the thread must be processing within Db2. If the thread does not terminate, it could be:

- Processing outside of Db2, possibly in the application. If that is the case, the thread does not terminate until the application makes a request to Db2. Use the z/OS CANCEL command to terminate the application immediately.
- Hung up in a network operation. Use VTAM or TCP/IP commands to cause the network operation to return processing to Db2, which allows the thread to be terminated.

Canceling SNA distributed threads with VTAM Commands:

If the CANCEL command does not terminate a distributed thread, it is possible that it is hung up in VTAM. Use the VTAM VARY NET,TERM command to cancel the thread's VTAM sessions.

To cancel a thread's VTAM session, you need to know the VTAM session IDs (SIDs) that correspond to the thread. Take the following steps:

1. Issue the Db2 command DISPLAY THREAD(*) LUWID(nnnn) DETAIL. (The value of *nnnn* is the token or LUWID provided by CANCEL DDF THREAD.)

This gives you the VTAM session IDs that must be canceled. Sessions are identified by the column header SESSID as shown in the following DISPLAY THREAD output:

```
-DIS THD(*) LUWID(123) DETAIL
```

```
DSNV401I - DISPLAY THREAD REPORT FOLLOWS:
DSNV402I - ACTIVE THREADS:
NAME      ST A  REQ ID      AUTHID  PLAN      ASID TOKEN
BATCH     TR *    5 BKH2C      SYSADM  BKH2      000D  123
V444-DB2NET.LUND0.C4B23F1F4D06=123 ACCESSING DATA AT
( 1)SAN JOSE-LUND1
V447--INDEX SESSID      A ST TIME
V448--( 1) 00D3590EA1E89701 S1 0923816181452
V448--( 1) 00D3590EA1E89822 N R1 0923816181584
DISPLAY ACTIVE REPORT COMPLETE
DSN9022I - DSNVDT '-DIS THD' NORMAL COMPLETION
```

The **N** indicates the thread is processing in VTAM.

2. Record positions 3 through 16 of SESSID for the threads to be canceled. (In the preceding DISPLAY THREAD output, the values are D3590EA1E89701 and D3590EA1E89822.)
3. Issue the VTAM command DISPLAY NET to display the VTAM session IDs. The ones you want to cancel match the SESSIDs in positions 3 through 16 and the corresponding session IDs are in bold. The following is an output example of this command:

```

D NET,ID=LUND0,SCOPE=ACT

IST097I DISPLAY ACCEPTED
IST075I NAME = LUND0, TYPE = APPL
IST486I STATUS= ACTIV, DESIRED STATE= ACTIV
IST171I ACTIVE SESSIONS = 0000000005, SESSION REQUESTS = 0000000000
IST206I SESSIONS:
IST634I NAME STATUS SID SEND RECV VR TP NETID
IST635I LUND1 ACTIV-S D24B171032B76E65 0051 0043 0 0 NET2
IST635I LUND1 ACTIV-S D24B171032B32545 0051 0043 0 0 NET2
IST635I LUND1 ACTIV-R D2D3590EA1E89701 0022 0031 0 0 NET2
IST635I LUND1 ACTIV-R D2D3590EA1E89802 0022 0031 0 0 NET2
IST635I LUND1 ACTIV-R D2D3590EA1E89822 0022 0031 0 0 NET2
IST314I END

```

4. Issue the VTAM command VARY NET,TERM for each of the VTAM SIDs associated with the Db2 thread. In this case, you might need to cancel only the session ID that DISPLAY THREAD shows to be processing in VTAM (D2D3590EA1E89822).

Canceling TCP/IP Distributed Threads with TCP/IP Commands:

If the CANCEL command does not terminate a distributed thread, the thread might be hung up in TCP/IP. Use the TCP/IP DROP command to cancel the thread's connection ID. To do this, you need to first determine the TCP/IP connection ID that corresponds to the thread.

Depending on whether the thread is a Db2 requester or server thread, take the following steps:

- Terminating TCP/IP connection for a requester thread:
 1. Issue the Db2 command DISPLAY THREAD(*) LUWID(nnnn) DETAIL. (The value of *nnnn* is the token or LUWID provided by DISPLAY THREAD.)

Find the IP address and local port for the connection to the partner, as shown in the following DISPLAY THREAD output:

```

#display thread(*) detail

DSNV401I # DISPLAY THREAD REPORT FOLLOWS -
DSNV402I # ACTIVE THREADS -
NAME ST A REQ ID AUTHID PLAN ASID TOKEN
TEST0001 TR 4 CTHDCORID001 SYSADM DONSQ1 0027 19
V444-USIBMSY.SYEC715B.C4B220851392=19 ACCESSING DATA AT
( 1)-STL714A-::FFFF:9.112.114.102..446
V447--INDEX SESSID A ST TIME
V448--( 1) 1028:446 N R2 0923814011448
DISPLAY ACTIVE REPORT COMPLETE
DSN9022I # DSNVDT '-DIS THD' NORMAL
COMPLETION

```

In this case, the partner's IP address and port is 9.112.114.102 446, and the local port is 1028. N indicates that the thread is processing in TCP/IP.

2. Determine the associated TCP/IP connection ID:

```

d tcpip,,netstat,conn,ipaddr=9.112.114.102

EZZ2500I NETSTAT CS V2R10 TCPIP
USER ID CONN LOCAL SOCKET FOREIGN SOCKET STATE
V71BDIST 0000049D 9.112.114.103..1028 9.112.114.102..446 ESTBLSH
1 OF 1 RECORDS DISPLAYED

```

3. Terminate the connection:

```

v tcpip,,drop,conn=0000049d

EZZ0060I PROCESSING COMMAND: VARY TCPIP,,DROP,
CONN=0000049D
EZZ0053I COMMAND VARY DROP COMPLETED
SUCCESSFULLY

```

- Terminating TCP/IP connection for a server thread:
 1. Issue the Db2 command DISPLAY THREAD(*) LUWID(nnnn) DETAIL. (The value of *nnnn* is the token or LUWID provided by CANCEL THREAD.)

Find the IP address and local port for the connection to the partner, as shown in the following DISPLAY THREAD output:

```
!display thread(*) detail

DSNV401I ! DISPLAY THREAD REPORT FOLLOWS -
DSNV402I ! ACTIVE THREADS -
NAME      ST A   REQ ID      AUTHID   PLAN      ASID TOKEN
TEST0001  RA *    2 CTHDCORID001 SYSADM   DONSQ11   002D    11
V445-USIBMSY.SYEC715B.C4B24232F81D=11 ACCESSING DATA FOR
( 1)::FFFF:9.112.114.103
V447--INDEX SESSID          A ST TIME
V448--( 1) 446:1029          W R2 0923816315680
DISPLAY ACTIVE REPORT COMPLETE
DSN9022I ! DSNVDT '-DIS THD' NORMAL COMPLETION
```

In this case, the partner's IP address is 9.112.114.103 and the local port is 1029.

2. Determine the associated TCP/IP connection ID:

```
d tcpip,,netstat,conn,ipaddr=9.112.114.103

EZZ2500I NETSTAT CS V2R8 TCPIP
USER ID  CONN      LOCAL SOCKET      FOREIGN SOCKET      STATE
V61ADIST 0000048E 9.112.114.102..446 9.112.114.103..1029 ESTABLS
1 OF 1 RECORDS
DISPLAYED
```

Find the entry where the foreign socket shows the partner's IP address and port (9.112.114.103 1029) and note the CONN.

3. Terminate the connection:

```
v tcpip,,drop,conn=0000048e

EZZ0060I PROCESSING COMMAND: VARY TCPIP,,DROP,
CONN=0000048E
EZZ0053I COMMAND VARY DROP COMPLETED SUCCESSFULLY
```

Using TCP/IP commands to cancel accelerated threads:

If the CANCEL command does not terminate an accelerated thread (a thread that has active accelerator processes running), the thread might be hung up in TCP/IP. Use the TCP/IP DROP command to cancel the thread's connection ID. To do this, you need to first determine the TCP/IP connection ID that corresponds to the thread.

- To terminate a TCP/IP connection for an accelerated thread:

1. Issue the Db2 command DISPLAY THREAD(*) ACCEL(*) DETAIL.
2. Find the IP address and local port for the connection to the partner, as shown in the following DISPLAY THREAD output:

```
)DISPLAY THREAD(*) ACCEL(*) DETAIL

DSNV401I ) DISPLAY THREAD REPORT FOLLOWS -
DSNV402I ) ACTIVE THREADS - 681
NAME      ST A   REQ ID      AUTHID   PLAN      ASID TOKEN
BATCH     AC *    39 ACCEL1      SYSADM   DSNTPE2   002B    3
V666 ACC=BLINK1,ADDR=:FFFF:9.30.30.177..446:1080
V436-PGM=DSNTEP2.DSNTPE2, SEC=1, STMNT=2256
DISPLAY ACTIVE REPORT COMPLETE
DSN9022I ) DSNVDT '-DIS THD' NORMAL COMPLETION
```

In this case, the partner's IP address is 9.30.30.177, the port is 446, and the local port is 1080. AC indicates that the thread is processing in an accelerator.

3. Determine the associated TCP/IP connection ID:

```
D TCPIP,,NETSTAT,CONN,IPADDR=9.30.30.177

EZD0101I NETSTAT CS V1R10 TCPIP
USER ID  CONN      STATE
```

```
V91ADBM1 000009E3 ESTBLSH
LOCAL SOCKET:  ::FFFF:9.30.222.34..1080
FOREIGN SOCKET: ::FFFF:9.30.30.177..446
1 OF 1 RECORDS DISPLAYED
END OF THE REPORT
```

In this case, the associated TCP/IP connection ID is 000009E3.

4. Terminate the connection:

```
V TCPIP, ,DROP,CONN=000009E3

EZZ0060I PROCESSING COMMAND: VARY TCPIP, ,DROP,CONN=000009E3
EZZ0053I COMMAND VARY DROP COMPLETED SUCCESSFULLY
```

Examples

Example: Canceling a local thread

To cancel a non-distributed thread whose token you found through the DISPLAY THREAD command and to produce a diagnostic dump, issue:

```
-CANCEL THREAD (123) DUMP
```

Example: Canceling a distributed thread

To cancel a distributed thread whose LUWID you found through the DISPLAY THREAD command, issue:

```
-CANCEL DDF THREAD (LUDALLAS.DB2SQL1.3042512B6425)
```

Suppose that the output from -DISPLAY THREAD shows that the thread-ID and token associated with this LUWID is 45162. You can also cancel this thread by issuing either of the following commands:

```
-CANCEL DDF THREAD (45162)
```

```
-CANCEL THREAD (45162)
```

Chapter 17. DCLGEN (DECLARATIONS GENERATOR) (DSN)

The declarations generator (DCLGEN) produces an SQL DECLARE TABLE statement and a COBOL, PL/I, or C data declaration for a table or a view named in the catalog.

Environment

The declarations generator is executed by the DSN subcommand DCLGEN. That subcommand can be issued from a DSN session, running in either foreground or background mode, or it can be issued through DB2I.

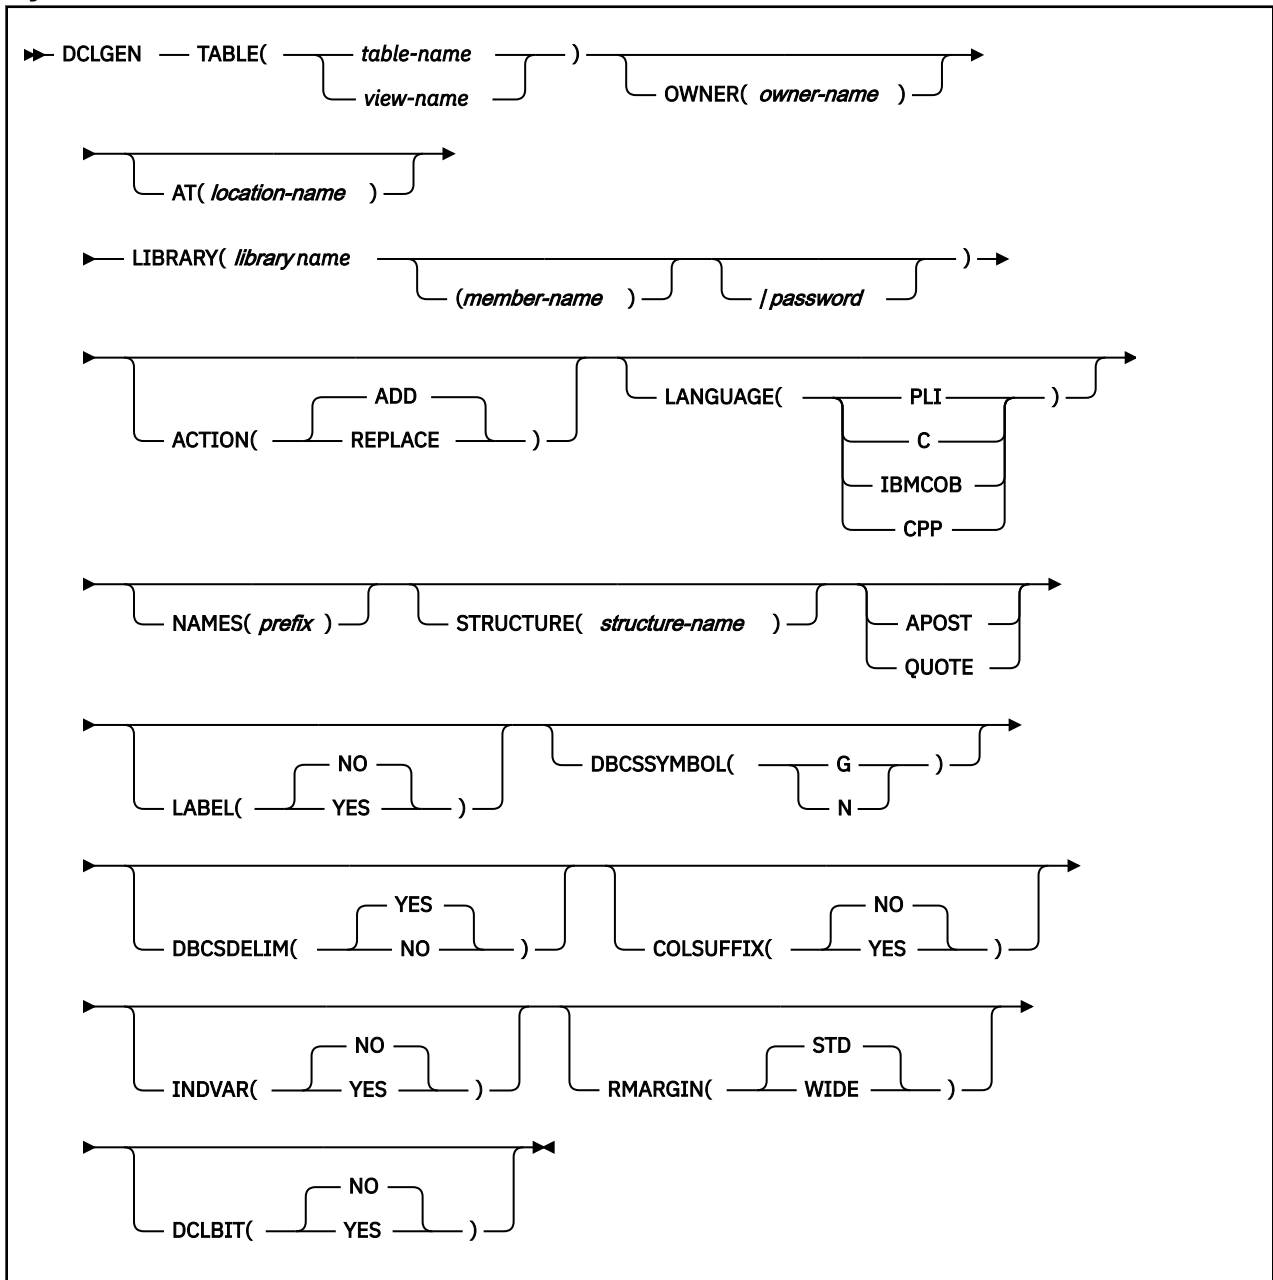

Data sharing scope: Group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- Ownership of the table or view
- SELECT privilege on the table or view
- DBADM authority on the database containing the table
- SYSADM authority
- SYSCTRL authority (catalog tables only)

Syntax

Option descriptions

TABLE

Specifies the table or view for which a declaration is generated. *table-name* or *view-name* is the qualified or unqualified name of the table or view.

The name must follow these rules:

- If the name is a single-byte or mixed string and contains special characters other than underscores (`_`), it must be enclosed between apostrophes (`'`). If the language is COBOL, single-byte underscores in the name are translated into hyphens (`-`) by DCLGEN. Double-byte character set (DBCS) names need not be enclosed in apostrophes.
- If the name contains single-byte apostrophes, each one must be doubled (`"`). (Some host languages do not permit apostrophes in variable names.)

A table or view name that contains a period and is not enclosed by apostrophes is a qualified table name. The characters to the left of the period constitute the table owner, and those to the right of

the period constitute the table name. Any table name enclosed in apostrophes is an unqualified table name. To understand how DCLGEN determines the table name qualifier, see the description of the OWNER option, which follows.

OWNER(*owner-name*)

Specifies a qualifier for the table name. *owner-name* is the qualifier for the table name.

If you specify a qualified table name for the TABLE(*table-name*) option, and you also specify OWNER(*owner-name*), the qualifier portion of *table-name* supersedes *owner-name* as the table name qualifier. If you specify an unqualified table name for the TABLE(*table-name*) option, and you do not specify OWNER(*owner-name*), the SQL authorization ID is the table name qualifier.

DCLGEN supports the use of underscore (`_`) as a valid character in the *owner-name* keyword parameter.

The following table illustrates the decision process for determining the DCLGEN table name qualifier.

Table 11. Decision process for determining the DCLGEN table name qualifier

Table name	OWNER(<i>owner-name</i>) specified	OWNER(<i>owner-name</i>) not specified
TABLE(<i>table-name</i>) qualified	<i>table-name</i> qualifier	<i>table-name</i> qualifier
TABLE(<i>table-name</i>) unqualified	<i>owner-name</i>	SQL authorization ID

AT(*location-name*)

Identifies the location of the table or view name specified in TABLE (*table-name*). *location-name* , which can consist of 1 to 16 characters, uniquely identifies an instance of a table or view in a network.

If you specify AT, *location-name* is used as the prefix for the table name, and *table-name* or *table-view* must be a qualified name.

DCLGEN supports the use of underscore (`_`) as a valid character in the *location-name* keyword parameter.

LIBRARY(*library-name* (*member-name*) / *password*)

Specifies the data set into which the declarations go. This data set must already exist and be accessible to the declarations generator. It can be either sequential or partitioned. *password* is optional.

If the library name is not enclosed within apostrophes, DCLGEN constructs the following full data set name:

```
user-prefix.library-name.language.(member-name)
```

where:

user-prefix

The user prefix of the primary authorization ID of the transaction.

language

The value of the LANGUAGE option: PLI, C, or COBOL.

(*member-name*)

Optional; if not used, the output goes to a sequential data set.

ACTION

Indicates whether to add or replace the data set.

(ADD)

Adds the data set as a new member, if it does not already exist.

The **default** is ACTION (ADD).

(REPLACE)

Replaces an existing member or data set with the new one. If the output is to a partitioned data set, and no member exists with the given name, one is added.

LANGUAGE

Specifies the language of the generated declaration.

Possible languages are:

- **(PLI)**, for PL/I
- **(C)**, for C/370
- **(IBMCOB)**, for IBM COBOL
- **(CPP)**, for C++

NAMES(*prefix*)

Allows field names to be formed in the declaration.

Avoid possible name conflicts between DCLGEN output and the source program. If a conflict occurs, use NAMES or STRUCTURE, or manually edit the generated declaration or source program.

prefix can contain double-byte characters.

The field names consist of *prefix* concatenated with a number from one to three digits in length. *prefix* can have up to 28 characters. If *prefix* is a single-byte or mixed string and the first character is not alphabetic, it must be enclosed in apostrophes. For example, if *prefix* is ABCDE, the field names will be ABCDE1, ABCDE2, and so on, up to a maximum of ABCDE999. Special characters can be used, but use caution to avoid possible name conflicts.

For COBOL and PL/I, if the *prefix* is a DBCS string, the field name will be the DBCS *prefix* concatenated with the DBCS representation of the number. For example, if *prefix* is <D1D2D3> (where "<" and ">" represent shift-out and shift-in characters, respectively, and D1D2D3 represent double-byte characters), generated field names will be <D1D2D3.1>, <D1D2D3.2>, and so on. The period (.) represents X'42'.

The column names in the table are taken as default names for the fields in the output.

STRUCTURE(*structure-name*)

Specifies the generated data structure.

structure-name can have up to 31 characters. If *structure-name* is a single-byte or mixed string and the first character is not alphabetic, it must be enclosed in apostrophes. You can use special characters, but use caution to avoid possible name conflicts.

structure-name can contain double-byte characters.

For SQL output, the name is the same as the table or view name. If the host language is C, the default structure name is the prefix DCL concatenated with the table name. If the host language is COBOL or PL/I and the table name is a single-byte or mixed string, the default structure name is also the prefix DCL concatenated with the table name. If the host language is COBOL or PL/I and the table name is a DBCS string, the default structure name is the prefix <.D.C.L> concatenated with the table or view name. "<" and ">" represent shift-out and shift-in characters, respectively. You must guard against possible conflicts with names in the source program. DCLGEN allows the specified structure name to be the same as the table or view name, but will issue a warning message.

APOST or QUOTE

Specifies the string delimiter character used in the host language. This option is effective only for COBOL programs.

APOST specifies the apostrophe (') as the host language string delimiter; the SQL delimiter is the quotation mark (").

QUOTE specifies the quotation mark (") as the host language delimiter; the SQL delimiter is the apostrophe (').

If neither APOST nor QUOTE is specified, the **default** is either APOST or QUOTE for COBOL, depending on what was specified on Db2 installation panel DSNTIPF.

The string delimiter delimits strings in host language statements. The SQL escape character delimits table and column names in the SQL DECLARE TABLE statement produced by DCLGEN. It is possible, by a choice made during Db2 installation, to make both delimiters the quotation mark or both the apostrophe.

LABEL

Indicates whether to include column labels in the output as comments. (Column labels can be assigned by the LABEL ON statement.)

(NO)

Omits the column labels.

(YES)

Includes the column labels.

DBCSSYMBOL

Specifies the symbol used to denote a graphic data type in a COBOL PICTURE clause.

(G)

Graphic data is denoted using G.

(N)

Graphic data is denoted using N.

DBCSDELIM

Specifies whether the DBCS table and column names in the generated DECLARE table statement will be delimited.

(YES)

DBCS table and column names will be delimited in the DCLGEN table declaration.

(NO)

DBCS table and column names will not be delimited in the DCLGEN table declaration.

COLSUFFIX

Determines whether to form field names by attaching the column name to the prefix given by the NAMES option.

(NO)

The column name is not used as a suffix, and field names are controlled by the option NAMES.

(YES)

If NAMES is specified, DCLGEN forms field names by adding column names as a suffix to the value of NAMES. For example, if the prefix given by NAMES is "NEW" and the column name is EMPNO, the field name is "NEWEMPNO".

If NAMES is **not** specified, DCLGEN issues a warning message and uses the column names as the field names.

INDVAR

Determines whether to create an indicator variable array for the host variable structure.

(NO)

DCLGEN does not create an indicator variable array.

(YES)

DCLGEN creates an indicator array for the host variable structure. The array name is the table name with a prefix of "I" (or DBCS letter "<I>" if the table name is double-byte).

RMARGIN

Specifies the break point for statement tokens that must be wrapped onto one or more subsequent records of DCLGEN output.

(STD)

Statement tokens will be wrapped after column 72.

(WIDE)

Statement tokens will be wrapped after column 80.

DCLBIT

Specifies whether to generate a DECLARE VARIABLE statement of SQL variables for columns that are defined as FOR BIT DATA. This statement is required in IBM COBOL applications that have host variables for FOR BIT DATA columns and are prepared by using the SQLCCSID option of the integrated Db2 coprocessor. The statement is also valid, but not currently required, for C/C++ and PL/I, and for COBOL that is not prepared by using the SQLCCSID option of the integrated Db2 coprocessor.

(NO)

Does not generate a DECLARE VARIABLE statement of SQL variables for columns that are defined as FOR BIT DATA.

(YES)

Generates a DECLARE VARIABLE statement of SQL variables for columns that are defined as FOR BIT DATA. If the table or view does not have any FOR BIT DATA columns, the statement is not generated.

Usage notes

Parsing of the DCLGEN command conforms to standard TSO parsing conventions.

The DECLARE statement: The DECLARE statement generated by DCLGEN will define all columns created with a data type of VARCHAR or LONG VARCHAR as VARCHAR. Columns created with a data type of VARGRAPHIC or LONG VARGRAPHIC will be defined as VARGRAPHIC.

Comments: The output for all host languages includes comments. The leading comment block echoes the DCLGEN subcommand that requested the declarations. The trailing comment block indicates the number of variables declared.

Using the output: To include the DCLGEN output in an application program, use the SQL INCLUDE statement. The same member name specified in the DCLGEN LIBRARY parameter is specified on the INCLUDE statement.

Prompts: Online TSO will prompt for missing or incorrectly specified options.

Editing the output: It is expected that the output of DCLGEN will not meet every need. You can freely edit the output before including it in a program. For example, you might want to change a variable name, or include SQL escape characters.

You can edit the output to add WITH DEFAULT to NOT NULL for columns that do not allow null values. If you edit the output, you must provide a default value.

If your column names contain embedded blanks, they will also be reflected in the host variable declarations, and you will have to remove, or translate, any blank characters to some other value.

For a column with an XML data type, DCLGEN generates the following output: SQL TYPE IS XML AS CLOB(1M). The default length value for the XML host variable is 1MB. You can manually update the DCLGEN output if you want a larger or smaller size.

C: DCLGEN support of the C language is unique in the following ways:

- DCLGEN does not fold the STRUCTURE, NAMES, or TABLE values to uppercase.
- For any Db2 column that has the data type CHAR(*n*), where *n* > 1, DCLGEN generates the corresponding host variable as CHAR(*n* + 1) to avoid the Db2 warning. For *n* = 1, the corresponding host variable is CHAR.

COBOL and binary integers: Db2 uses the full size of binary integers. It can place larger values than allowed in the specified number of digits in a COBOL variable, which can result in truncated values. To avoid this problem, you can modify the DCLGEN output to declare COBOL variables that correspond to binary integer columns with USAGE COMP-5 instead of USAGE COMP or USAGE BINARY.

COBOL and the underscore character: DCLGEN translates any underscore characters in the table's column names into hyphens (-) for use in the generated structure.

COBOL and DBCS: Although Db2 accepts values outside of the range from X'41' to X'FE', in COBOL data definition statements, both bytes of each double-byte character in data names must be within this range. Data names must also contain at least one DBCS character that does not have X'42' as its first byte.

Data declarations for arrays of indicator variables: If DCLGEN creates an array of indicator variables, data declarations have the following form:

Language Data declaration

C	short int <i>Itable-name</i> [<i>n</i>];
COBOL	01 <i>Itable-name</i> PIC S9(4) USAGE COMP OCCURS <i>n</i> TIMES
PL/I	DCL <i>Itable-name</i> (<i>n</i>) BIN FIXED (15);

n is the number of columns in the table.

Examples

Example: Using DCLGEN to generate PL/I host variable declarations for columns in a Db2 table

The following subcommand generates PL/I declarations for table VEMPL and writes them to data set member *prefix*.SRCLIB.DATA(DSN8MPPEM). The host structure and field names are generated from the table and column names.

```
DCLGEN TABLE(VEMPL) -
  LIBRARY('
prefix
.SRCLIB.DATA(DSN8MPPEM)') -
  LANGUAGE(PLI) -
  APOST
```

The output looks like this:

```
/******  
/* DCLGEN TABLE(VEMPL) -  
/* LIBRARY('  
prefix  
.SRCLIB.DATA(DSN8MPPEM)') -  
/* LANGUAGE(PLI) -  
/* APOST  
/* ... IS THE DCLGEN COMMAND THAT MADE THE FOLLOWING STATEMENTS  
/******  
EXEC SQL DECLARE VEMPL TABLE  
  ( EMPNO CHAR(6) NOT NULL,  
    FIRSTNAME VARCHAR(12) NOT NULL,  
    MIDINIT CHAR(1) NOT NULL,  
    LASTNAME VARCHAR(15) NOT NULL,  
    WORKDEPT CHAR(3) NOT NULL  
  ) ;  
/******  
/* PLI DECLARATION FOR TABLE VEMPL  
/******  
DCL 1 DCLVEMPL,  
  5 EMPNO CHAR(6),  
  5 FIRSTNAME CHAR(12) VAR,  
  5 MIDINIT CHAR(1),  
  5 LASTNAME CHAR(15) VAR,  
  5 WORKDEPT CHAR(3);  
/******  
/* THE NUMBER OF COLUMNS DESCRIBED BY THIS DECLARATION IS 5  
/******
```

Example: Using DCLGEN NAMES and STRUCTURE options to specify a field name prefix and structure name for the generated output

The following subcommand generates PL/I declarations for table VEMPL and writes them to data set member *prefix*.SRCLIB.DATA(DSN8MPPEM). The generated PL/I declarations are in a structure named EMPRECORD, and all host variable names consist of the string FIELD, followed by a number.

```
DCLGEN TABLE(VEMPL) -
  LIBRARY('
```

```

prefix
.SRCLIB.DATA(DSN8MPPEM)') -
    LANGUAGE(PLI) -
    NAMES(FIELD) -
    STRUCTURE(EMPREGORD) -
    APOST

```

The output looks like this:

```

/*****
/* DCLGEN TABLE(VEMPL) -
/*      LIBRARY('
prefix
.SRCLIB.DATA(DSN8MPPEM)') -
/*      LANGUAGE(PLI) -
/*      NAMES(FIELD) -
/*      STRUCTURE(EMPREGORD) -
/*      APOST
/* ... IS THE DCLGEN COMMAND THAT MADE THE FOLLOWING STATEMENTS
/*****
EXEC SQL DECLARE VEMPL TABLE
( EMPNO          CHAR(6) NOT NULL,
  FIRSTNME       VARCHAR(12) NOT NULL,
  MIDINIT        CHAR(1) NOT NULL,
  LASTNAME       VARCHAR(15) NOT NULL,
  WORKDEPT      CHAR(3) NOT NULL
) ;

/*****
/* PLI DECLARATION FOR TABLE VEMPL
/*****
DCL 1 EMPREGORD,
    5 FIELD1     CHAR(6),
    5 FIELD2     CHAR(12) VAR,
    5 FIELD3     CHAR(1),
    5 FIELD4     CHAR(15) VAR,
    5 FIELD5     CHAR(3);

/*****
/* THE NUMBER OF COLUMNS DESCRIBED BY THIS DECLARATION IS 5
/*****

```

Example: Generating DECLARE variable statements for columns that are defined with FOR BIT DATA

The following subcommand generates COBOL declarations for table MYTABLE, which contains FOR BIT DATA columns. The DCLBIT(YES) option is specified to cause DCLGEN to generate DECLARE VARIABLE statements for the FOR BIT DATA columns so that applications that include the generated declaration compile correctly when they are compiled with the SQLCCSID option of the Db2 coprocessor.

```

DCLGEN TABLE(MYTABLE)
  LIBRARY('prefix.SRCLIB.DATA(MYTABLE))
  LANGUAGE(COBOL)
  APOST
  DCLBIT(YES)

```

The output looks like this:

```

*****
* DCLGEN TABLE(MYTABLE)
*      LIBRARY('prefix.SRCLIB.DATA(MYTABLE))
*      LANGUAGE(COBOL)
*      APOST
*      DCLBIT(YES)
* ... IS THE DCLGEN COMMAND THAT MADE THE FOLLOWING STATEMENTS
*****
EXEC SQL DECLARE MYTABLE TABLE
( COL1          CHAR(10) NOT NULL,
  COL2          CHAR(10),
  COL3          VARCHAR(12) NOT NULL,
  COL4          VARCHAR(12) NOT NULL
) END-EXEC.
*****
* DECLARED VARIABLES FOR 'FOR BIT DATA' COLUMNS
*****
EXEC SQL DECLARE
  :COL2
  ,:COL4

```

```

VARIABLE FOR BIT DATA END-EXEC.
*****
* COBOL DECLARATION FOR TABLE MYTABLE
*****
01 DCLMYTABLE.
   10 COL1          PIC X(10).
   10 COL2          PIC X(10).
   10 COL3.
      49 COL3-LEN    PIC S9(4) USAGE COMP.
      49 COL3-TEXT   PIC X(12).
   10 COL4.

      49 COL4-TEXT   PIC X(12).
*****
* THE NUMBER OF COLUMNS DESCRIBED BY THIS DECLARATION IS 4
*****

```

Chapter 18. -DISPLAY ACCEL (Db2)

The DISPLAY ACCEL command displays information about accelerator servers.

Abbreviation: -DIS ACCEL

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (Db2 COMMANDS), an IMS or CICS terminal, or a program that uses the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the SCOPE option.

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- DISPLAY privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization by using primary and secondary authorization IDs.

Syntax

Option descriptions

(*accelerator-name*)

The accelerator server name. This option limits the display to the specified accelerator servers.

(*)

Requests a list of all accelerator servers, whether the servers are currently in use or not. Specifying an asterisk (*) as the accelerator name indicates that the display must include all accelerator servers.

DETAIL

Displays additional information for one or more of the accelerator servers. If `DETAIL` is not specified, a basic summary report is produced.

LIST

Produces a list of accelerator servers that are currently in use or that have been started. Valid values are:

(ACTIVE)

Restricts the list of accelerator servers to those that are currently in use.

(*)

Requests a list of all accelerator servers, whether they are currently in use or not. An accelerator that has just been created appears in the list only if it has been started by using the START ACCEL command.

SCOPE

Specifies the scope of the command. In a non-data-sharing environment, the option is ignored. Valid values are:

(LOCAL)

Displays information only for the accelerator servers for the current data sharing member.

(GROUP)

Displays information for accelerator servers for all members of the data sharing group.

MEMBER

Restricts the display for the identified accelerator server to specific members of the data sharing group. The default behavior is to display accelerator servers on the local member in a data sharing environment. This option is not supported in non-data sharing environments.

Output

Message [DSNX830I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Examples

Example 1: Displaying information about all accelerator servers for a data sharing group

The following command displays information about all of the accelerator servers for all members in a data sharing group:

```
-DIS ACCEL(*) SCOPE(GROUP) LIST(*)
```

The output is similar to the following example:

```
DSNX810I  -DB1A DSNX8CMD DISPLAY ACCEL FOLLOWS -
DSNX830I  -DB1A DSNX8CDA
ACCELERATOR          MEMB  STATUS  REQUESTS  ACTV  QUED  MAXQ

ACCEL2             DB1D  STOPPED       0      0      0      0
ACCEL3             DB1D  STOPPED       21      0     11     11
DISPLAY ACCEL REPORT COMPLETE
-----END OF DISPLAY FOR MEMBER: DB1D -----
DSN9022I  -DB1A DSNX8CMD '-DISPLAY ACCEL' NORMAL COMPLETION

```

Example 2: Displaying detailed information about specific accelerator servers

The following command displays detailed information about active accelerator servers ACCEL1 and ACCEL2 for data sharing member DB1D:

```

-DIS ACCEL (ACCEL1,ACCEL2)
  DETAIL
  LIST(ACTIVE)
  SCOPE(LOCAL)
  MEMBER(DB1D)

```

The output that is displayed depends on the accelerators that you are using. For example, the following output is displayed for IBM Db2 Analytics Accelerator for z/OS V5 and earlier:

```

ACCELERATOR          MEMB  STATUS  REQUESTS  ACTV  QUED  MAXQ
-----
ACCEL1             DB1D  STARTED      9210      7      5      9
LOCATION=ACCELERATOR1 HEALTHY
DETAIL STATISTICS
  LEVEL = AQT05015
  STATUS = ONLINE
  FAILED REQUESTS = 3
  AVERAGE QUEUE WAIT = 99
  MAXIMUM QUEUE WAIT = 400
  TOTAL NUMBER OF ACTIVE PROCESSORS = 4
  AVERAGE CPU UTILIZATION ON COORDINATOR NODES = 45.00%
  AVERAGE CPU UTILIZATION ON WORKER NODES = 40.00%
  AVERAGE DISK IO UTILIZATION = 10.00%
  NUMBER OF ACTIVE WORKER NODES = 2
  TOTAL DISK STORAGE = 93000 MB
  DISK STORAGE IN USE FOR THIS DB2 SYSTEM = 27 MB
  DISK STORAGE IN USE FOR ALL DB2 SYSTEMS = 27 MB
  TOTAL CPU FOR REQUESTS FOR THIS DB2 SYSTEM = 30 MS
  TOTAL CPU FOR DATA MAINTENANCE FOR THIS DB2 SYSTEM = 110 MS
  TOTAL CPU FOR REPLICATION FOR THIS DB2 SYSTEM = 0 MS
DISPLAY ACCEL REPORT COMPLETE
DSN9022I ) DSNX8CMD '-DISPLAY ACCEL' NORMAL COMPLETION

```

If you are using IBM Db2 Analytics Accelerator for z/OS V6 or later, output similar to the following example is displayed. A value of N/A in any field indicates that the field does not apply to your installation or is reserved for future use.

```

ACCELERATOR          MEMB  STATUS  REQUESTS  ACTV  QUED  MAXQ
-----
ACCEL1             DB1D  STARTED      9210      7      0  N/A

                                                PER SECOND
OUTBOUND NETWORK UTILIZATION OF THE ACCELERATOR =          2 KB
                                                PER SECOND

DISPLAY ACCEL REPORT COMPLETE
DSN9022I ) DSNX8CMD '-DISPLAY ACCEL' NORMAL COMPLETION
```

Related information

[IBM Db2 Analytics Accelerator for z/OS documentation](#)

Chapter 19. -DISPLAY ARCHIVE (Db2)

The Db2 command DISPLAY ARCHIVE displays input archive log information.

Abbreviation: -DIS ARC

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- DISPLAY system privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

```
➤➤ DISPLAY ARCHIVE ➤➤
```

Output

Message [DSNJ322I](#) (Db2 Messages) indicates the beginning of the output of the command.

Usage note

Data sharing members: Although the command ARCHIVE LOG SCOPE(GROUP) or ARCHIVE LOG MODE(QUIESCE) initiates archive processing for all members of a data sharing group, the command DISPLAY ARCHIVE shows information only for the member for which it is issued. To display input archive log information for all members of a data sharing group, enter the command on each member.

Examples

Example: Displaying information about archive log data sets

Issue the following command to display information about archive log data sets that are in use:

```
-DISPLAY ARCHIVE
```

The output is similar to the following output:

```
DSNJ322I -DISPLAY ARCHIVE REPORT FOLLOWS
              COUNT      TIME
              (TAPE UNITS) (MIN, SEC)
DSNZPARM      2          0,00
CURRENT       2          0,00
=====
```

```

ADDR STAT CORR-ID VOLSER DATASET_NAME

BDDD BUSY 10LPLALR ARN738 DSNT2AR1.DT25.D04170.T1506437.A0012743
END OF DISPLAY ARCHIVE REPORT.

```

FL 502 The output is similar to the following if the data set is encrypted:

```

DSNJ322I -DISPLAY ARCHIVE REPORT FOLLOWS
COUNT TIME
(TAPE UNITS) (MIN,SEC)
DSNZPARM 2 0,00
CURRENT 2 0,00
=====
ADDR STAT CORR-ID VOLSER DATASET_NAME

KEY LABEL = DB2SYSTEMKEY02
END OF DISPLAY ARCHIVE REPORT.

```

The report shows the following information:

- The subsystem parameter values for MAX RTU (COUNT) and DEALLC PERIOD TIME as recorded in the DSNZPxxx load module
- Current specifications for the COUNT and TIME parameters
- Availability status of allocated archive log data sets
- Volume and data set names that are associated with current archive log read requests
- KEY LABEL information

Chapter 20. -DISPLAY BLOCKERS (Db2)

The Db2 command DISPLAY BLOCKERS displays locks and claims that active threads hold against the databases that are specified in the command.

Abbreviation: -DIS BL

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2COMMANDS), an IMS™ or CICS® terminal, or a program using the instrumentation facility interface (IFI).

Authorization

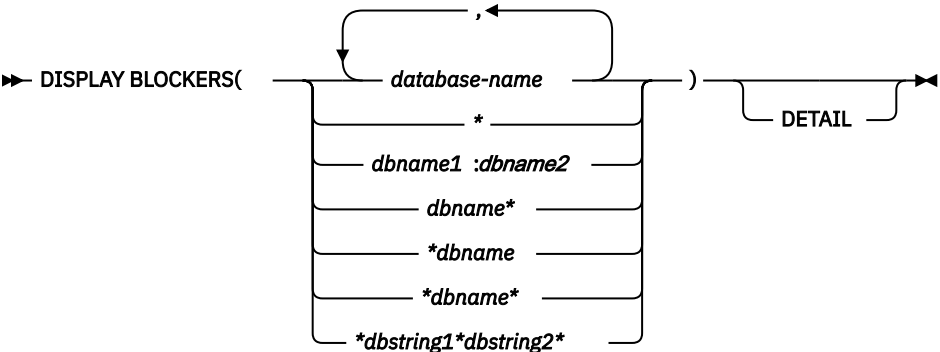

The DISPLAY system privilege allows users to obtain information for any database. The resulting DISPLAY BLOCKERS output lists the databases for which the primary authorization ID or any of the secondary authorization IDs has the DISPLAYDB privilege. An error message is produced if the set of privileges for a specified database does not include one of the following privileges or authorities:

- DISPLAYDB privilege
- DISPLAY privilege
- DBMAINT authority
- DBCTRL authority
- DBADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

For implicitly created databases, the database privilege or authority can be held on the implicitly created database or on DSND B04.

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

(*database-name*,...)

Identifies one or more databases that you want to display information for. The *dbname* and *dbstring* variables can have any of the forms that are listed in the following table, where *dbname1* and *dbname2* represent any 1- to 8-character string, and *dbname* represents any 1- to 7-character string:

Table 12. Forms of <i>dbname</i> and <i>dbstring</i>	
Form	Displays the information of...
<i>dbname1:dbname2</i>	All databases with names, in UNICODE order, that are between <i>dbname1</i> and <i>dbname2</i> inclusive
<i>dbname*</i>	All databases with names that begin with the string <i>dbname</i>
<i>*dbname</i>	All databases with names that end with the string <i>dbname</i>
<i>*dbname*</i>	All databases with names that contain the string <i>dbname</i>
<i>*dbstring1*dbstring2*</i>	All databases with names that contain the strings <i>dbstring1</i> and <i>dbstring2</i>

(*)

Displays information about all databases that are defined to the Db2 subsystem for which the privilege set of the process has the required authorization.

DETAIL

Displays additional report information about each lock or claim. If DETAIL is not specified, a basic summary report is produced that displays a maximum of 5,000 locks and claims. When DETAIL is specified, the report displays a maximum of 1,000 locks and claims.

Output

Message DSNT369I indicates the beginning of the command output. For a detailed description of the output, see [DSNT369I](#).

Examples

Displaying summary information about locks and claims that are held against specified databases

The following command displays a basic summary report about locks and claims that are held against the Db2 catalog and directory databases.

```
-DISPLAY BLOCKERS (DSNDB06,DSNDB01)
```

The output is similar to this output:

```
DSNT360I  -DB2A *****
DSNT369I  -DB2A *   DISPLAY BLOCKERS SUMMARY REPORT
          *   2020-02-18-15.21.10.467383

Chapter 21. -DISPLAY BUFFERPOOL (Db2)

The Db2 command DISPLAY BUFFERPOOL displays the current status for one or more active or inactive buffer pools.

Abbreviation: -DIS BPOOL

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

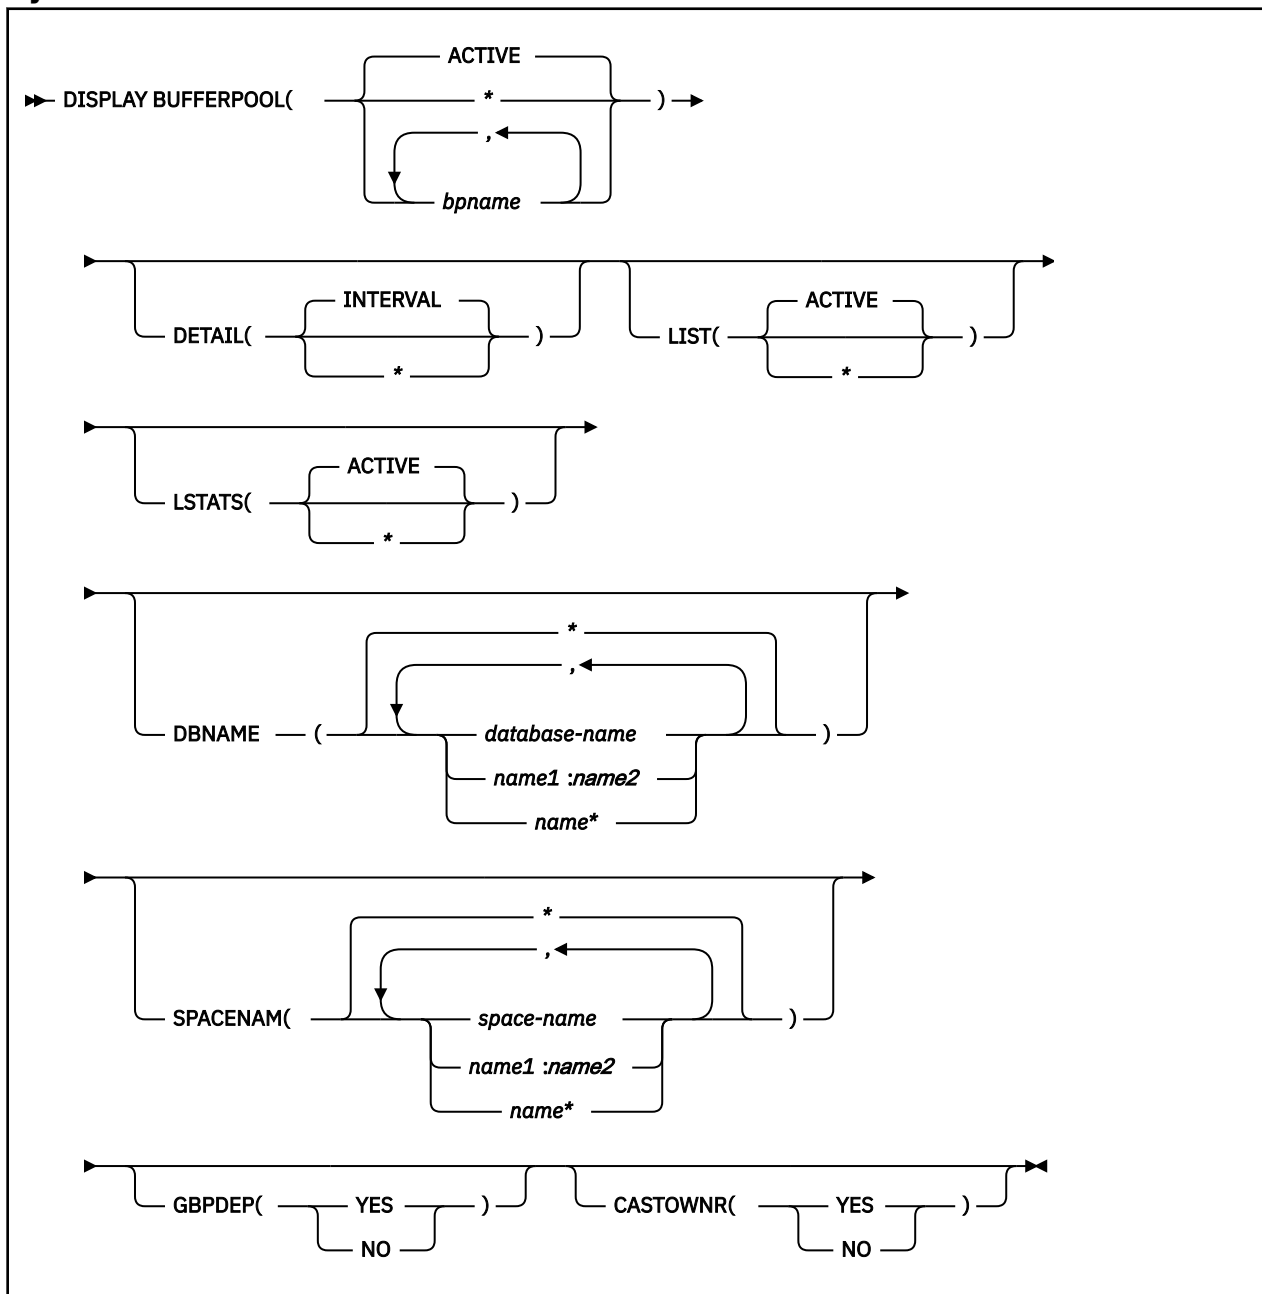

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- DISPLAY system privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

(ACTIVE)

Displays the current buffer pool status for all active buffer pools.

(*)

Displays the current buffer pool status for all active or inactive buffer pools.

(bpname)

Names the buffer pool for which current status is to be displayed.

- 4-KB page buffer pools are named BP0 through BP49
- 8-KB page buffer pools are named BP8K0 through BP8K9
- 16-KB page buffer pools are named BP16K0 through BP16K9
- 32-KB page buffer pools are named BP32K through BP32K9

DETAIL

Produces a detail report for one or more buffer pools. If DETAIL is not specified, a summary report is produced.

(INTERVAL)

Requests statistics accumulated since the last incremental display, or since the buffer pool was first activated if no previous incremental display exists.

(*)

Requests statistics accumulated since the buffer pool was first activated.

LIST

Lists the open index spaces and table spaces associated with the buffer pools included in the report. Basic information is provided for non-data-sharing systems while more detail is provided if data sharing is active.

(ACTIVE)

Restricts the list of open index spaces and table spaces to those that are currently in use.

(*)

Requests a list of all open index spaces and table spaces, whether currently in use or not.

LSTATS

Lists data set statistics for the open index spaces and table spaces associated with the buffer pools included in the report. The statistics displayed are incremental since the last time they were displayed.

(ACTIVE)

Restricts the list statistics to those data sets that are currently in use.

The default is ACTIVE when LIST is not specified or if LIST is specified with no parameter. If LIST is specified with a parameter and LSTATS has no parameter, the parameter specified for LIST is used for LSTATS.

(*)

Includes statistics for all open index spaces and table spaces, whether currently in use or not.

DBNAME

Specifies which databases are included in the LIST display and the LSTATS display. If you specify DBNAME without LIST, LIST(ACTIVE) is assumed.

Abbreviation: DBN

(*database-name* , ...)

Identifies one or more databases to be included in the LIST and LSTATS displays. *database-name* can have any of the forms in the following list. In the list, *name1* and *name2* represent strings of one- to eight-characters. *name* represents a string of one- to eight-characters.

Form

Displays the status of...

name1

The database *name1*

name1:name2

All databases with names from *name1* to *name2* in a sorted list of database names.

name*

All databases whose names begin with the string *name*

(*)

Displays information on all databases that match the LIST specification. This is the default.

SPACENAM

Specifies which table spaces or index spaces within the specified databases to include in the LIST display and the LSTATS display. If you use SPACENAM without DBNAME, DBNAME(*) is assumed.

Abbreviation: SPACE

(*)

Displays information about all table spaces and index spaces of the specified databases. This is the default.

(space-name , ...)

Identifies one or more spaces to be included in the LIST and LSTATS displays. You can write *space-name* like *database-name* to designate:

- The name of a single table space or index space
- A range of names
- A partial name followed by a pattern-matching character

GBPDEP

Indicates whether to restrict the list of data sets to those that are group buffer pool dependent. This option is not valid if this is a non-data sharing Db2.

(YES)

Restricts the list of page sets to those that are group buffer pool dependent (GBP-dependent). An index space or table space is GBP-dependent if either of these conditions are true:

- Inter-Db2 R/W interest exists in it.
- Changed pages from it exist in the group buffer pool that have not yet been written to disk.

(NO)

Restricts the list of page sets to those that are non-group buffer pool dependent.

CASTOWNR

Indicates whether to restrict the list of data sets to those for which this Db2 member is the castout owner. This option is not valid if this is a non-data sharing Db2.

(YES)

Restricts the list of page sets for which this Db2 member is the castout owner.

(NO)

Restricts the list of page sets for which this Db2 member is not the castout owner.

Output

Message [DSNB401I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Examples

You can generate a summary report for a buffer pool.

```
-DISPLAY BUFFERPOOL(BP0)
```

You can generate detail report that includes all summary report information and additional buffer pool related statistics, by specifying the DETAIL keyword.

```
-DISPLAY BUFFERPOOL(BP0) DETAIL
```

You generate a summary or detail report that also lists open table spaces and index spaces associated with the buffer pool, by specifying the LIST keyword.

```
-DISPLAY BUFFERPOOL(BP0) LIST
```

You generate statistics report for each table space and index space that is associated with a buffer pool, by specifying the LSTATS keyword. LSTATS(*) specifies that the output includes statistics for both active and inactive index spaces and table spaces.

```
-DISPLAY BUFFERPOOL(BP0) LSTATS(*)
```

Related information

[DSNB401I \(Db2 Messages\)](#)

DSNB401I

BUFFERPOOL NAME *bp-name*, BUFFERPOOL ID *bp-id*, USE COUNT *use-count*

Explanation

This message displays output from the DISPLAY BUFFERPOOL command. For each buffer pool, this message marks the beginning of multiple lines of information about that buffer pool. Some lines in the output have their own message numbers or alphanumeric identifiers to assist with identification.

The first line (DSNB401I) contains the following information:

bp-name

The external name of the buffer pool. *bp-name* can be one of the following values: BP0 to BP49, BP8K0 to BP8K9, BP16K0 to BP16K9, BP32K, or BP32K1 to BP32K9.

bp-id

The internal identifier for the buffer pool. *bp-id* can be one of the following values: 0 to 49, 80 to 89, 100 to 109, or 120 to 129.

use-count

The number of open table spaces or index spaces that use this buffer pool. A value of zero means that the buffer pool is inactive.

The remaining output for each buffer pool consists of one or more of the following sections, in the indicated order:

- [DSNB402I: Information about allocation status](#)
- [DSNB404I: Threshold information](#)
- [DSNB406I: PGFIX and PGSTEAL information](#)
- [DSNB409I: Start time of the statistics interval for DETAIL\(INTERVAL\)](#)
- [DSNB410I: Start time of the statistics interval for DETAIL\(*\)](#)
- [DSNB411I: Page read statistics](#)
- [DSNB412I: Sequential prefetch statistics](#)
- [DSNB413I: List prefetch statistics](#)
- [DSNB414I: Dynamic prefetch statistics](#)
- [DSNB415I: Prefetch statistics](#)
- [DSNB416I: Overflow statistics for PGSTEAL\(NONE\) buffer pools](#)
- [DSNB420I: Page write statistics](#)
- [DSNB421I: Page-write threshold statistics](#)
- [DSNB431I: Information about allocation status for simulated buffer pools](#)
- [DSNB432I: Simulated buffer pool activity](#)
- [DSNB440I: Parallel activity statistics](#)
- [DSNB441I: LPL activity statistics](#)
- [DSNB453I: Cached and changed page statistics](#)
- [DSNB455I: Synchronous I/O delay statistics](#)
- [DSNB456I: Asynchronous I/O delay statistics](#)
- [DSNB457I: Simulated buffer pool page statistics](#)

- [DSNB460I: Page set and partition list information \(for a data-sharing environment\)](#)
- [DSNB464I: Page set and partition list information \(for a non-data-sharing environment\)](#)
- [DSNB466I: Page set and partition statistics](#)
- [DSNB467I: Data set statistics](#)
- [DSNB546I: Frame size allocation](#)
- [DSNB550I: Page stealing method change](#)

If information cannot be reported, one or more of the following messages is returned:

- [DSNB408I: No detail statistics available](#)
- [DSNB459I: Open failure for a data set](#)
- [DSNB463I: No objects matched selection criteria](#)

The DISPLAY BUFFERPOOL output ends with one of the following messages:

- [DSN9022I: Normal completion](#)
- [DSNB499I: Display terminated because of insufficient space](#)

DSNB402I: Information about allocation status

The basic buffer pool information is followed by a description of the allocation status of the buffer pool.

The values of VPSIZE MINIMUM and VPSIZE MAXIMUM are used only when AUTOSIZE =YES.

```
DSNB402I - BUFFER POOL SIZE = pool-size BUFFERS  AUTOSIZE = autosize
          VPSIZE MINIMUM = minimum size VPSIZE MAXIMUM = maximum-size
          ALLOCATED      = allocated-buffers  TO BE DELETED = delete-buffers
          IN-USE/UPDATED = current-buffers
          OVERFLOW ALLOC = over-buffers
```

BUFFER POOL SIZE = *pool-size* BUFFERS

The user-specified buffer pool size.

AUTOSIZE = *autosize*

The buffer pool AUTOSIZE attribute that is applicable to the current allocation of the buffer pool.

YES

The buffer pool uses Workload Manager (WLM) services, if available, to automatically adjust the size of the buffer pool. The size is adjusted based on dynamic monitoring of the workload goals and the storage that is available on the system.

NO

The buffer pool does not use WLM services for automatic sizing adjustment of buffer pools.

VPSIZE MINIMUM = *minimum size*

The minimum size of the buffer pool. This value is meaningful only when the value of *autosize* is YES. If the value was never specified, a value of 0 is shown, and Db2 uses a default value of 75% of the specified value of VPSIZE.

VPSIZE MAXIMUM = *maximum-size*

The maximum size of the buffer pool. This value is meaningful only when the value of *autosize* is YES. If the value was never specified, a value of 0 is shown, and Db2 uses the defaults value, which is 25% greater than the specified VPSIZE value.

ALLOCATED = *allocated-buffers*

The number of allocated buffers in an active buffer pool.

TO BE DELETED = *delete-buffers*

The number of buffers to be deleted in an active buffer pool because of pool contraction.

IN-USE/UPDATED = *current-buffers*

The number of currently active buffers in the buffer pool. These buffers cannot be stolen.

OVERFLOW ALLOC = *over-buffers*

The number of allocated buffers in the overflow area for a buffer pool that uses PGSTEAL(NONE). The buffers that are allocated to the overflow area are counted within of the VPSIZE value, and they are counted as part of the ALLOCATED value.

DSNB404I: Threshold information

The information about allocation status is followed by information about the user-modifiable thresholds for the buffer pool.

```
DSNB404I - THRESHOLDS -
VP SEQUENTIAL           = vpseq
SP SEQUENTIAL           = spseq
DEFERRED WRITE          = dwt
VERTICAL DEFERRED WRT   = dvv1, dvv2
PARALLEL SEQUENTIAL     = vppseqt
ASSISTING PARALLEL SEQT = vpxpseqt
```

vpseq

The sequential steal threshold for the virtual pool, expressed as a percentage of the total buffer pool size.

spseq

The sequential steal threshold for the simulated pool, expressed as a percentage of the total simulated buffer pool size.

dwt

The free-buffer deferred write threshold for the buffer pool, expressed as a percentage of the total buffer pool size.

dvv1

The vertical deferred write threshold for the buffer pool, expressed as a percentage of the total buffer pool size.

dvv2

The vertical deferred write threshold for the buffer pool, expressed as an absolute number of buffers. *dvv2* is used to determine the threshold only if *dvv1* is 0 and *dvv2* is non-zero. Otherwise, *dvv1* is used to determine the threshold.

vppseqt

The sequential threshold for parallel query processing, expressed as a percentage of the virtual sequential steal threshold. When the threshold is set to 0, parallel query processing is not supported.

vpxpseqt

The assisting parallel sequential threshold, expressed as a percentage of the sequential threshold for parallel query processing. Use the *vpxpseqt* value to control how much buffer resource is used when this Db2 member is assisting another member of the group in parallel processing. When the threshold is set to 0, this buffer pool is not used to assist other data-sharing members in processing a query. In a non-data-sharing environment, this value is ignored.

DSNB406I: PGFIX and PGSTEAL information

The DISPLAY BUFFERPOOL output includes a description of the PGFIX and PGSTEAL attributes for the buffer pool.

CURRENT = *current-pgfix*

The value of the page fix (PGFIX) attribute for the current allocation of the buffer pool.

YES

The buffer pool is fixed in real storage for the long term.

NO

The buffer pool is fixed in real storage only during an I/O operation.

PENDING = *pending-pgfix*

The value of the PGFIX attribute that is to be applied for the next allocation of the virtual buffer pool.

YES

The buffer pool is to be fixed in real storage for the long term.

NO

The buffer pool is to be fixed in real storage only during an I/O operation.

PAGE STEALING METHOD -**CURRENT = *current-pgsteal***

The value of the page stealing method that is in use for the buffer pool

LRU

The least recently used (LRU) algorithm is used to manage page stealing. This method is the default value.

FIFO

The first-in, first-out (FIFO) algorithm is used to manage page stealing.

NONE

No page stealing occurs. Objects that use this buffer pool are kept resident.

PENDING = *pending-pgsteal*

The value of the page stealing method (PGSTEAL) that is to be applied for the next allocation of the virtual buffer pool.

LRU

The least recently used (LRU) algorithm is used to manage page stealing. This method is the default value.

FIFO

The first-in, first-out (FIFO) algorithm is used to manage page stealing.

NONE

No page stealing occurs. Objects that use this buffer pool are kept resident.

DSNB408I: No detail statistics available

DSNB408I indicates that, although you specified the DETAIL option on the DISPLAY BUFFERPOOL command, no detail statistics are available for the requested buffer pool. The statistics are not available because the pool has not been activated since Db2 started.

BUFFER POOL *bp-name*

The name of the buffer pool.

DSNB409I: Start time of the statistics interval for DETAIL(*INTERVAL*)

When you specify the DETAIL(*INTERVAL*) option, the output includes the start time of the interval for which the statistics were accumulated.

```
DSNB409I - INCREMENTAL STATISTICS SINCE base-time
```

base-time

The start time. This value is either the time of the previous incremental display or, if no previous incremental display exists, the time that the buffer pool was first activated.

The format is *hh:mm:ss month dd, yyyy*

hh:mm:ss

The time expressed as hour:minutes:seconds.

month

An alphanumeric abbreviation for the month. For example, a value of OCT means October.

dd

The day of the month.

yyyy

The year.

DSNB410I: Start time of the statistics interval for DETAIL(*)

When you specify the DETAIL(*) option, the output includes the start time of the interval for which the statistics were accumulated.

```
DSNB410I - CUMULATIVE STATISTICS SINCE base-time
```

base-time

The start time. This value is the time the buffer pool was first activated.

The format is *hh:mm:ss month dd, yyyy*

hh:mm:ss

The time expressed as hour:minutes:seconds.

month

An alphanumeric abbreviation for the month. For example, a value of OCT means October.

dd

The day of the month.

yyyy

The year.

DSNB411I: Page read statistics

When you specify the DETAIL option, the output includes the page read statistics for the buffer pool.

```
DSNB411I - RANDOM GETPAGE      = rgp  
          SYNC READ I/O (R) = srr  
          SEQ.   GETPAGE      = sgp  
          SYNC READ I/O (S) = srs  
          SYNC READ I/O (ZHL) = srrz  
          DMTH HIT          = dmt  
          PAGE-INS REQ      = pir  
          SEQUENTIAL        = seq  
          VPSEQT HIT        = vsh  
          RECLASSIFY        = rcy
```

RANDOM GETPAGE = rgp

The number of nonsequential GETPAGE requests.

SYNC READ I/O (R) = srr

The number of synchronous read I/O operations for nonsequential GETPAGE requests.

SYNC READ I/O (ZHL) = srrz

The number of synchronous read I/O operations using zHyperLink.

SEQ. GETPAGE = sgp

The number of sequential GETPAGE requests.

SYNC READ I/O (S) = srs

The number of synchronous read I/O operations for sequential GETPAGE requests.

DMTH HIT = dmt

The number of times that the data management threshold was reached.

PAGE-INS REQ = pir

The number of page-in operations that are required for read I/O.

SEQUENTIAL = seq

The number of buffers on the sequential least-recently-used (SLRU) chain.

VPSEQT HIT = *vsh*

The number of times that the size of the SLRU chain reached the sequential steal threshold (the VPSEQT value) for the buffer pool.

RECLASSIFY = *rcy*

A statistic that is used by IBM for serviceability.

Related information:

[Buffer pool thresholds that you can change \(Db2 Performance\)](#)
[Chapter 6, “-ALTER BUFFERPOOL \(Db2\),” on page 27](#)

DSNB412I: Sequential prefetch statistics

When you specify the DETAIL option, the output includes the sequential prefetch statistics for the buffer pool.

REQUESTS = *pft*

The number of times that sequential prefetch was requested.

PREFETCH I/O = *pio*

The number of sequential prefetch read I/O operations.

PAGES READ = *pfp*

The number of pages that are read because of sequential prefetch.

Related information:

[Sequential prefetch \(PREFETCH='S'\) \(Db2 Performance\)](#)

DSNB413I: List prefetch statistics

When you specify the DETAIL option, the output includes the list prefetch statistics for the buffer pool.

```
DSNB413I - LIST PREFETCH -
           REQUESTS      =      pft  PREFETCH I/O    =      pio
           PAGES READ    =      pfp
```

REQUESTS = *pft*

The number of times that list prefetch was requested.

PREFETCH I/O = *pio*

The number of list prefetch read I/O operations.

PAGES READ = *pfp*

The number of pages that are read because of list prefetch.

Related information:

[List prefetch \(PREFETCH='L' or 'U'\) \(Db2 Performance\)](#)

DSNB414I: Dynamic prefetch statistics

When you specify the DETAIL option, the output includes the dynamic prefetch statistics for the buffer pool.

```
DSNB414I - DYNAMIC PREFETCH -
           REQUESTS      =      pft  PREFETCH I/O    =      pio
           PAGES READ    =      pfp
```

REQUESTS = *pft*

The number of times that dynamic prefetch was requested.

PREFETCH I/O = *pio*

The number of dynamic prefetch read I/O operations.

PAGES READ = *pfp*

The number of pages that are read because of dynamic prefetch.

Related information:

[Dynamic prefetch \(PREFETCH='D'\) \(Db2 Performance\)](#)

DSNB415I: Prefetch statistics

When you specify the DETAIL option, the output includes the prefetch statistics for the buffer pool.

```
DSNB415I - PREFETCH DISABLED -  
          NO BUFFER           =      pfd    NO READ ENGINE   =      ree
```

NO BUFFER = *pf**d*

The number of times that prefetch was disabled for one of the following reasons:

- The buffer pool reached the prefetch disabled threshold (90% full).
- A user disabled prefetch by setting the VPSEQT threshold for the buffer pool to zero.

NO READ ENGINE = *ree*

The number of times that prefetch was disabled because an asynchronous read processor was not available.

Related information:

[Read operations and prefetch I/O \(Db2 Performance\)](#)

DSNB416I: Overflow statistics for PGSTEAL(NONE) buffer pools

When you specify the DETAIL option, the output includes the page read statistics for the overflow area.

```
DSNB416I - OVERFLOW RANDOM GETPAGE    = argp  
          OVERFLOW SYNC READ I/O (R) = asrr  
          OVERFLOW SEQ.  GETPAGE      = asgp  
          OVERFLOW SYNC READ I/O (S) = asrs
```

OVERFLOW RANDOM GETPAGE = *argp*

The number of nonsequential getpage requests that use overflowed buffers.

OVERFLOW SYNC READ I/O (R) = *asrr*

The number of synchronous read I/O operations for nonsequential getpage requests that use overflowed buffers.

OVERFLOW SEQ. GETPAGE = *asgp*

The number of sequential getpage requests that use overflowed buffers.

OVERFLOW SYNC READ I/O (S) = *asrs*

The number of synchronous read I/O operations for sequential getpage requests that use overflowed buffers.

Related information:

[Choosing a page-stealing algorithm \(Db2 Performance\)](#)

DSNB420I: Page write statistics

When you specify the DETAIL option, the output includes the page write statistics for the buffer pool.

SYS PAGE UPDATES = *pages-updated*

The number of buffer updates.

SYS PAGES WRITTEN = *pages-written*

The number of pages that are written to disk.

ASYNCR WRITE I/O = *async-writes*

The number of asynchronous write I/O operations.

SYNCR WRITE I/O = *sync-writes*

The number of synchronous write I/O operations.

PAGE-INS REQ = *page-ins*

The number of page-ins that are required for write I/O.

DSNB421I: Page-write threshold statistics

When you specify the DETAIL option, the output includes the page-write threshold statistics for the buffer pool.

```
DSNB421I - DWT HIT          =          dwt VERTICAL DWT HIT =          vdw
```

DWT HIT = *dwt*

The number of times that the deferred write threshold was reached.

VERTICAL DWT HIT = *vdw*

The number of times that the vertical deferred write threshold was reached.

Related information:

[Buffer pool thresholds that you can change \(Db2 Performance\)](#)

DSNB431I: Information about allocation status for simulated buffer pools

The description of the allocation status of the buffer pool is followed by a description of the allocation status of the simulated buffer pool.

```
DSNB431I - SIMULATED BUFFER POOL SIZE = pool-size BUFFERS
          ALLOCATED          = allocated-buffers
          IN-USE             = current-in-use HIGH-IN-USE = high-in-use
          SEQ-IN-USE         = current-sequential-in-use HIGH SEQ-IN-USE = high-sequential-in-use
```

SIMULATED BUFFER POOL SIZE = *pool-size* BUFFERS

The user-specified simulated buffer pool size.

ALLOCATED = *allocated-buffers*

The number of simulated buffers that are currently allocated in the simulated buffer pool.

IN-USE = *current-in-use*

The number of simulated buffers that are currently being used to track pages.

HIGH IN-USE = *high-in-use*

The highest number of simulated buffers that have been in use in the simulated buffer pool since the buffer pool simulation began.

SEQ IN-USE = *current-sequential-in-use*

The number of simulated buffers for sequentially accessed pages that are currently in use in the simulated buffer pool.

HIGH SEQ-IN-USE = *high-sequential-in-use*

The highest number of simulated buffers for sequentially accessed pages that have been in use in the simulated buffer pool since the buffer pool simulation began.

DSNB432I: Simulated buffer pool activity

When you specify the DETAIL option, the output includes statistics on activity in the simulated buffer pool, including the numbers of page accesses that the buffer pool simulation determined could be avoided, for various types of read activity.

```
DSNB432I - SIMULATED BUFFER POOL ACTIVITY -
          AVOIDABLE READ PAGE MISSES -
          SYNC FROM DASD (R) = pages-sync-rand-dasd
          SYNC FROM DASD (S) = pages-sync-seq-dasd
          ASYNC FROM DASD    = pages-async-dasd
          SYNC FROM GBP (R)  = pages-sync-rand-gbp
          SYNC FROM GBP (S)  = pages-sync-seq-gbp
          ASYNC FROM GBP     = pages-async-gbp
          PAGES MOVED INTO SIMULATED BUFFER POOL = pages-to-sim-bp
          TOTAL AVOIDABLE SYNC I/O DELAY = sync-io-delay MILLISECONDS
```

pages-sync-rand-dasd

The number of pages accessed randomly by avoidable synchronous read I/O from disk.

pages-sync-seq-dasd

The number of pages accessed sequentially by avoidable synchronous read I/O from disk.

pages-async-dasd

The number of pages prefetched by avoidable asynchronous read I/O from disk.

pages-sync-rand-gbp

The number of pages accessed randomly by avoidable synchronous read from the group buffer pool..

pages-sync-seq-gbp

The number of pages accessed sequentially by avoidable synchronous read from the group buffer pool.

pages-async-gbp

The number of pages accessed by avoidable asynchronous read from the group buffer pool.

pages-to-sim-bp

The number of pages that were logically moved from the virtual buffer pool into the simulated buffer pool.

sync-io-delay

The total time in milliseconds that the buffer pool simulation determined would be spent waiting for synchronous read I/O from disk.

DSNB440I: Parallel activity statistics

When you specify the DETAIL option, the output includes statistics about parallel activities for the buffer pool.

```
DSNB440I - PARALLEL ACTIVITY -
          PARALLEL REQUEST =      tpa   DEGRADED PARALLEL =      dpa
```

PARALLEL REQUEST = *tpa*

The total number of negotiations with the buffer pool for the requested number of sequential prefetch streams.

DEGRADED PARALLEL = *dpa*

The total number of times that the negotiation resulted in the degraded mode of parallel operations.

DSNB441I: LPL activity statistics

When you specify the DETAIL option, the output includes statistics about LPL activity for the buffer pool.

```
DSNB441I - LPL ACTIVITY -
          PAGES ADDED      =      pages
```

pages

The total number of pages for all page sets that are added to the logical page list (LPL) in this buffer pool.

This value is equal to the number of DSNB250E messages that are written to the system log after the most recent execution of the DISPLAY BUFFERPOOL command with the DETAIL option.

Related information:

[DSNB250E \(Db2 Messages\)](#)

[Displaying the logical page list \(Db2 Administration Guide\)](#)

[Characteristics of pages that are in error \(Db2 Administration Guide\)](#)

DSNB453I: Cached and changed page statistics

The output includes the number of cached pages and changed pages in the buffer pool for a data set if all of the following conditions are true:

- You specified the LSTATS option on the DISPLAY BUFFERPOOL command.
- The buffer pool is an active buffer pool.
- The number of cached and changed pages are not zero.

The relevant table space or index space is identified in either line DSNB464I or line DSNB465I. The data set is identified in line DSNB466I.

DSNB453I - VP CACHED PAGES -					
CURRENT	=	<u>vcount</u>	MAX	=	<u>mvcount</u>
CHANGED	=	<u>ccount</u>	MAX	=	<u>mccount</u>

CURRENT = vcount

The number of cached pages in the virtual pool for the data set. This value is the number of buffers that contain pages for the data set in the buffer pool.

MAX = mvcount

The maximum number of cached pages in the virtual pool for the data set since the last DISPLAY BUFFERPOOL command with the LSTATS option was issued.

CHANGED = ccount

The number of changed pages in the virtual pool for the data set. This value is the number of buffers that were changed in the buffer pool for the data set.

MAX = mccount

The maximum number of changed pages in the virtual pool for the data set since the last DISPLAY BUFFERPOOL command with the LSTATS option was issued.

DSNB455I: Synchronous I/O delay statistics

The output includes synchronous I/O delay statistics if all of the following conditions are true:

- You specified the LSTATS option on the DISPLAY BUFFERPOOL command.
- The buffer pool is an active buffer pool.
- The values of the synchronous I/O delay statistics are not zero.

These synchronous I/O delay statistics are reported for a data set for an open table space or index space that is associated with the buffer pool. The values that are listed are the statistics that were gathered since the last display for the data set.

The relevant table space or index space is identified in either line DSNB464I or line DSNB465I. The relative data set within the table space or index space is identified in line DSNB466I.

DSNB455I - SYNCHRONOUS I/O DELAYS -	
AVERAGE DELAY	= <u>avd</u>
MAXIMUM DELAY	= <u>mxd</u>
TOTAL PAGES	= <u>tpg</u>

avd

The average I/O delay in microseconds for pages in the data set.

mxd

The maximum I/O delay in microseconds for pages in the data set.

tpg

The total number of pages that are read or written for the data set.

SYNCHRONOUS I/O DELAYS WITH ZHYPERLINK -	
AVERAGE DELAY	= <u>avdz</u>
MAXIMUM DELAY	= <u>mxdz</u>
TOTAL PAGES	= <u>tpgz</u>

avdz

The average I/O delay in microseconds for pages in the data set when zHyperLink is used.

mxdz

The maximum I/O delay in microseconds for pages in the data set when zHyperLink is used.

tpgz

The total number of pages that are read or written for the data set when zHyperLink is used.

Related information:

DSNB456I: Asynchronous I/O delay statistics

The output includes asynchronous I/O delay statistics if all of the following conditions are true:

- You specified the LSTATS option on the DISPLAY BUFFERPOOL command.
- The buffer pool is an active buffer pool.
- The values of the asynchronous I/O delay statistics are not zero.

These asynchronous I/O delay statistics are reported for a data set for an open table space or index space that is associated with the buffer pool. The values that are listed are the statistics that were gathered since the last display for the data set.

The relevant table space or index space is identified in either line DSNB464I or line DSNB465I. The relative data set within the table space or index space is identified in line DSNB466I.

```
DSNB456I - ASYNCHRONOUS I/O DELAYS -
          AVERAGE DELAY      = avd
          MAXIMUM DELAY       = mxd
          TOTAL PAGES         = tpg
          TOTAL I/O COUNT     = tio
```

avd

The average I/O delay in microseconds for pages in the data set.

mxd

The maximum I/O delay in microseconds for pages in the data set.

tpg

The total number of pages that are read or written for the data set.

tpg

The total number of I/O operations that are issued for the data set.

DSNB457I: Simulated buffer pool page statistics

The output includes the number of simulated pages in the simulated buffer pool for a data set if all of the following conditions are true:

- You specified the LSTATS option on the DISPLAY BUFFERPOOL command.
- The buffer pool is an active buffer pool.
- The number of simulated pages in the simulated buffer pool is not zero.

The relevant table space or index space is identified in either line DSNB464I or line DSNB465I. The data set is identified in line DSNB466I.

```
DSNB457I - NUMBER OF PAGES IN THE SIMULATED BUFFER POOL -
          CURRENT      = scount MAX      = mscount
```

CURRENT = *scount*

The number of pages from the data set that are currently simulated in the simulated buffer pool.

MAX = *mscount*

The maximum number of pages from the data set that have been simulated in the simulated buffer pool since the last DISPLAY BUFFERPOOL command with the LSTATS option was issued.

DSNB459I: Open failure for a data set

Message DSNB459I indicates that a previous attempt to access a data set failed because of an allocation or open error. This message is displayed only when you specify the LIST option on the DISPLAY BUFFERPOOL command for an active buffer pool and this error condition occurs.

The relevant table space or index space is identified in either line DSNB464I or line DSNB465I.

```
DSNB459I - csect-name OPEN FAILURE HAS OCCURRED FOR DATASET dsn
```

csect-name

The name of the control section that issued the message.

DATASET = *dsn*

The data set number. This value is the relative data set number within a table space or index space.

Other data set and buffer pool information might be displayed in subsequent messages.

DSNB460I: Page set and partition list information (for a data-sharing environment)

When you specify the LIST option, the output includes information about page sets and partition lists.

The message output begins with the introductory text PAGE SET/PARTITION LIST INFORMATION. The introductory text is followed by column headers and multiple lines of information.

```
DSNB460I  @
-----PAGE SET/PARTITION LIST INFORMATION-----
-----DATA SHARING INFO-----
          TS GBP  MEMBER  CASTOUT  USE  P-LOCK
DATABASE SPACE NAME  INST PART  IX DEP   NAME   OWNER  COUNT STATE
=====
=====
```

The output contains the following columns, in the indicated order:

DATABASE

The name of the database. This field is blank when the line provides information about the same database as the preceding line or lines.

SPACE NAME

The name of the table space. This field is blank when the line provides information about the same table space as the preceding line or lines.

INST

The instance number.

PART

One of the following values:

- The partition number.
- For a simple table space or simple index space: a blank.
- For non-partitioned indexes on a partitioned table space: the logical partition number preceded by the character L (for example, L01).

TS IX

The type of object: either TS for table space or IX for index space.

GBP DEP

An indicator of group buffer pool (GBP) dependency. The indicator can be either of the following values:

Y

The page set or partition is GBP-dependent.

N

The page set or partition is not GBP-dependent.

MEMBER NAME

The name of the member that the detail line pertains to.

CASTOUT OWNER

An indicator of whether the member is the castout owner. The indicator can be either of the following values:

Y

The member is the castout owner.

Blank

The member is not the castout owner.

USE COUNT

The number of active claimers or drainers for the page set or partition for the member.

P-LOCK STATE

The P-lock state that the member currently holds. The state can be any of the following values:

IS

R/O interest. Other members have interest in this page set or partition. The page set or partition is GBP-dependent.

IX

R/W interest. Other members have interest in this page set or partition. The page set or partition is GBP-dependent.

S

R/O interest. Other members might be reading the page set or partition. The page set or partition is not GBP-dependent.

SIX

R/W interest. Other members might be reading the page set or partition. The page set or partition is GBP-dependent.

NSU

R/W interest. The page set or partition is GBP-dependent.

X

R/W interest. No other members are accessing the page set or partition. The page set or partition is not GBP-dependent.

US

A temporary state that can be held by a restarting Db2 when "waiting for retained locks" is enabled.

number

A number for use as a diagnostic aid. A number is displayed only when a DISPLAY BUFFERPOOL command encounters an undefined lock state.

If the DISPLAY BUFFERPOOL LIST command finds more than 255 lines of output to display, the output is presented in multiple sections. Each section is a new instance of message DSNB460I with the addition of "(CONTINUED)" in the message heading:

```
DSNB460I  @ (CONTINUED)
```

Message DSNB460I is issued in a data-sharing environment. In a non-data-sharing environment, message DSNB464I is issued instead.

If no information is available, message DSNB460I is followed by message DSNB463I.

DSNB463I: No objects matched selection criteria

Message DSNB463I indicates that Db2 did not find any page sets or partitions that matched the selection criteria.

```
DSNB463I  - * * * NO OBJECTS MATCHED LIST/LSTATS SELECTION CRITERIA
```

For example, this message is displayed for DIS BPOOL(BP0) GBPDEP(Y) if Db2 did not find any page sets or partitions that are group-buffer-pool dependent (GBP-dependent).

When message DSNB463I is returned, the DISPLAY BUFFERPOOL command terminates normally.

If you expected to see a list of page sets or partitions, review and correct the syntax of the DISPLAY BUFFERPOOL command as needed. Consider adding or changing the filter keywords to obtain a list of page sets or partitions.

DSNB464I: Page set and partition list information (for a non-data-sharing environment)

When you specify the LIST option, the output includes information about page sets and partition lists.

The message output begins with the introductory text PAGE SET/PARTITION LIST INFORMATION. The introductory text is followed by column headers and multiple lines of information.

```
DSNB464I  @
PAGE SET/PARTITION LIST INFORMATION
          TS  USE
DATABASE SPACE NAME  INST PART IX COUNT
=====
=====
```

DATABASE

The name of the database. This field is blank when the line provides information about the same database as the preceding line or lines.

SPACE NAME

The name of the table space. This field is blank when the line provides information about the same table space as the preceding line or lines.

INST

The instance number.

PART

One of the following values:

- The partition number.
- For a simple table space or simple index space, a blank.
- For non-partitioned indexes on a partitioned table space, the logical partition number preceded by the character L (for example, L01).

TS IX

The type of object: either TS for table space or IX for index space.

USE COUNT

The number of active claimers or drainers for the page set or partition for the member.

If the DISPLAY BUFFERPOOL LIST command finds more than 255 lines of output to display, the output is presented in multiple sections. Each section is a new instance of message DSNB464I with the addition of "(CONTINUED)" in the message heading:

```
DSNB464I  @ (CONTINUED)
```

Message DSNB464I is issued in a non-data-sharing environment. In a data-sharing environment, message DSNB460I is issued instead.

If no information is available, message DSNB464I is followed by message DSNB463I.

DSNB466I: Page set and partition statistics

When you specify the LSTATS option, the output includes statistics for data sets. Those statistics are introduced by message DSNB466I.

DSNB467I: Data set statistics

When you specify the LSTATS option, the output includes statistics about data sets for objects that are associated with active buffer pools.

```
DSNB467I - STATISTICS FOR object-type database-name.space-name INSTANCE instance-number -
DATA SET #: set-number USE COUNT: application-count
```

STATISTICS FOR *object-type*

The type of object: either TABLE SPACE or INDEX SPACE.

database-name

The name of the database.

space-name

The name of the table space or index space.

instance-number

The instance number of the table space or index space.

DATA SET #: set-number

The relative data set number within the table space or index space.

USE COUNT: application-count

The number of applications that have a claim or drain on the page set or partition.

This message is followed by one or more of the following messages: DSNB453I, DSNB455I, or DSNB456I.

Related information:

[Claims and drains \(Db2 Performance\)](#)

DSNB546I: Frame size allocation

Message DSNB546I describes the frame size allocation status of the buffer pool. If the specified number of buffers with the specified frame size are not available, Db2 allocates some of the buffers with a different frame size. In that case, Db2 issues multiple instances of this message to show the number of buffers that are allocated with each frame size.

```
DSNB546I - PREFERRED FRAME SIZE preferred-size buffer-count BUFFERS USING frame-size FRAME SIZE
ALLOCATED
```

preferred-size

The requested frame size. If you used the ALTER BUFFERPOOL command with the FRAMESIZE option, the specified FRAMESIZE value is displayed as *preferred-size*.

This value can be 4K, 1M, or 2 GB.

buffer-count

The number of buffers that are allocated with the *frame-size* value. This value might include storage frames that have been logically removed from the buffer pool, but which Db2 cannot yet free.

frame-size

The actual frame size that Db2 used for the buffers.

This value can be 4K, 1M, or 2 GB.

DSNB550I: Page stealing method change

Message DSNB550I is displayed only after a buffer pool is allocated for which the requested FRAMESIZE and PGSTEAL values are FRAMESIZE(2G) and PGSTEAL(NONE).

```
DSNB550I - CURRENT PAGE STEALING METHOD = NONE
          PAGE STEALING METHOD BEING USED = LRU
```

PGSTEAL(NONE) and FRAMESIZE(2G) are not compatible in Db2 12. If you specify these options together, Db2 issues message DSNB549I and uses the PGSTEAL(LRU) algorithm until the next allocation of the buffer pool. However, PGSTEAL(NONE) is recorded in the BSDS. To use PGSTEAL(NONE), specify FRAMESIZE(1M) or FRAMESIZE(4K). For more information, see "Changed behavior for PGSTEAL(NONE) buffer pools" in [Storage release incompatibilities in Db2 12 \(Db2 for z/OS What's New?\)](#).

DSN9022I: Normal completion

The DISPLAY THREAD output normally ends with message DSN9022I.

Related information:

[DSN9022I \(Db2 Messages\)](#)

DSNB499I: Display terminated because of insufficient space

If the DISPLAY BUFFERPOOL output is too long, the output ends with message DSNB499I. This message indicates that the command was unable to obtain storage for more messages. This situation occurs only for a long display request, such as a detail display for many buffer pools.

The output is truncated.

Reissue the DISPLAY BUFFERPOOL command, and specify a smaller number of buffer pools.

System action

Processing continues.

Related tasks

[Monitoring buffer pools \(Db2 Administration Guide\)](#)

[Monitoring and tuning buffer pools by using online commands \(Db2 Performance\)](#)

Related reference

[-DISPLAY BUFFERPOOL \(Db2\)](#)

The Db2 command DISPLAY BUFFERPOOL displays the current status for one or more active or inactive buffer pools.

[-ALTER BUFFERPOOL \(Db2\)](#)

The Db2 command ALTER BUFFERPOOL alters attributes for active or inactive buffer pools. Altered values are used until altered again.

Chapter 22. -DISPLAY DATABASE (Db2)

The Db2 command DISPLAY DATABASE displays status information about Db2 databases.

The DISPLAY DATABASE command displays information about the status of the following objects:

- Db2 databases
- Table spaces
- Tables in segmented table spaces
- XML table spaces
- LOB table spaces
- Index spaces within a database
- Indexes on auxiliary tables
- Partitions of partitioned table spaces
- Partitions of index spaces

DISPLAY DATABASE RESTRICT indicates if a table space, index space, or partition is in any pending status. Use the ADVISORY option without the RESTRICT option to display any objects that are in an advisory pending status, such as the informational COPY-pending status or auxiliary warning advisory status.

In a data sharing environment, the command can be issued from any Db2 subsystem in the group that has access to the database.

Abbreviation: -DIS DB

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group

Authorization

The DISPLAY system privilege allows you to display status information for any database. The resulting display lists those databases for which the primary authorization ID or any of the secondary authorization IDs has the DISPLAYDB privilege. Error messages are produced for those databases specified over which the set of privileges does not include one of the following privileges or authorities:

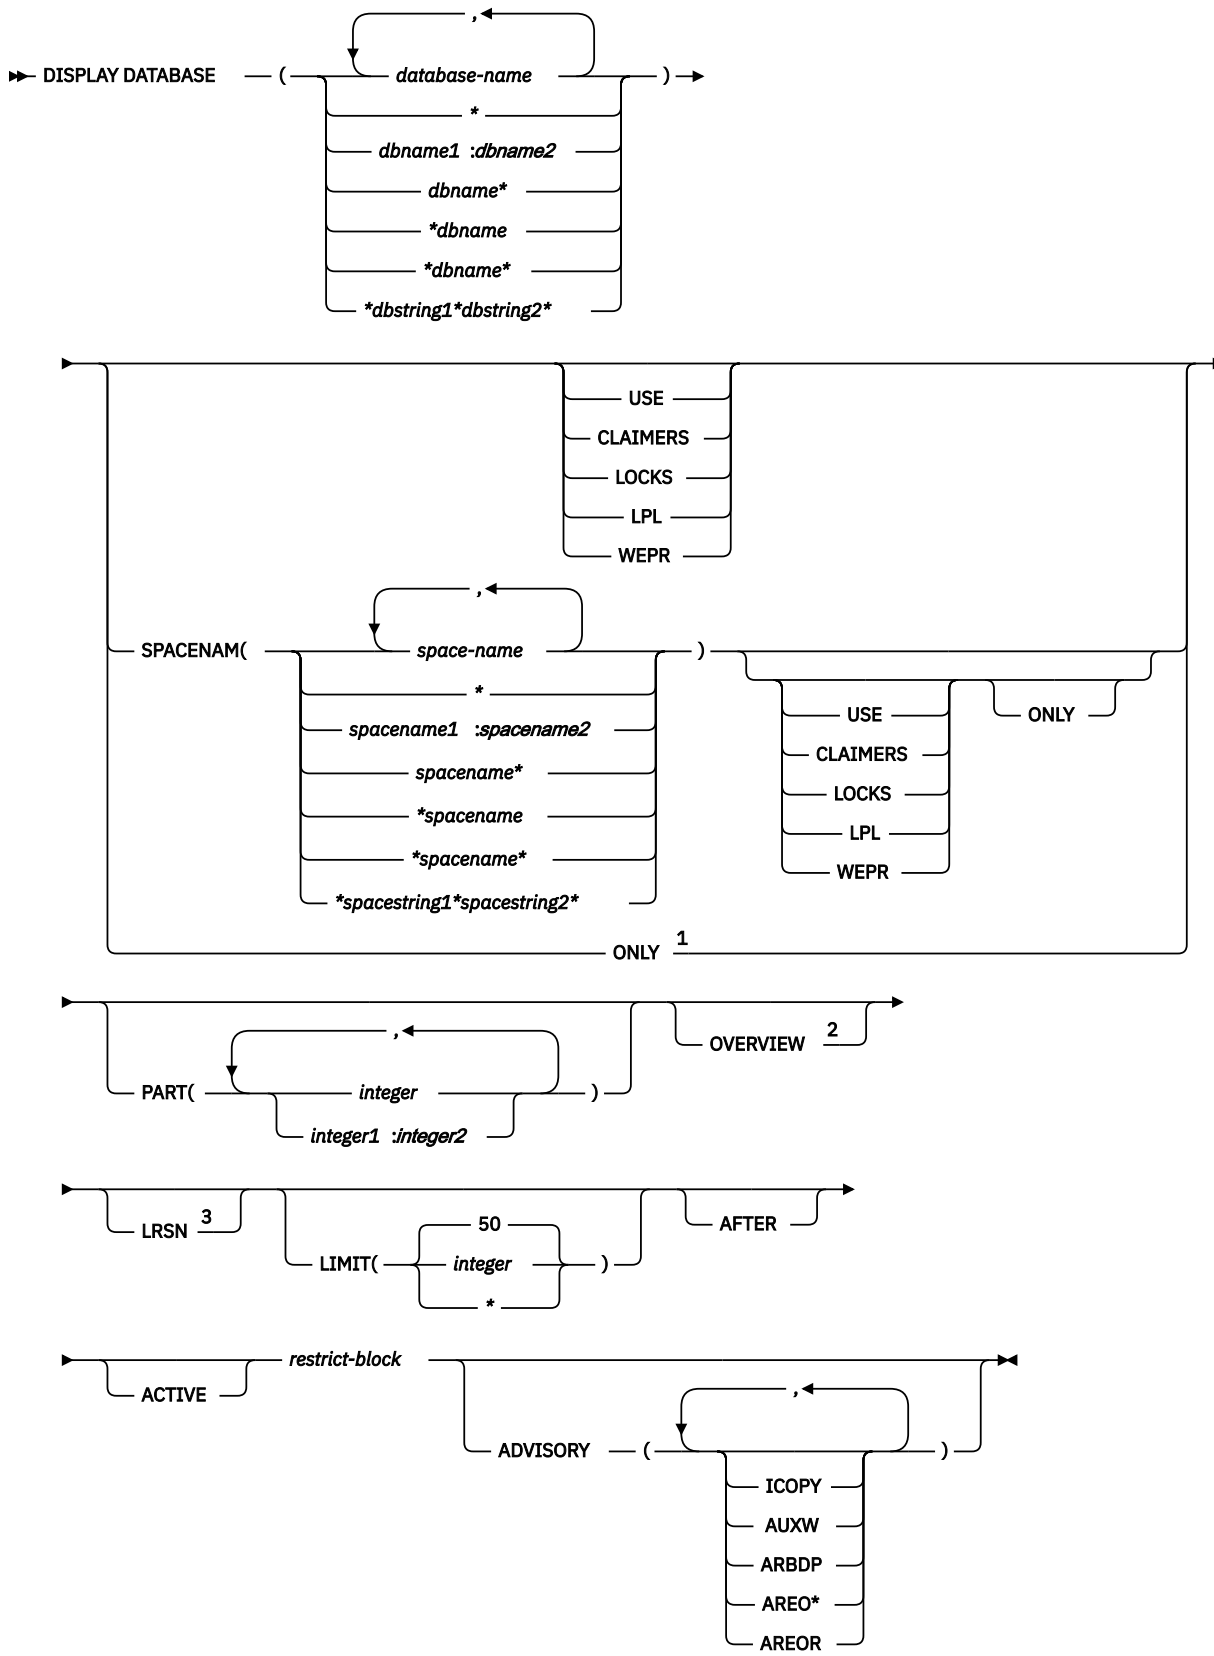

- DISPLAYDB privilege
- DISPLAY privilege
- DBMAINT authority
- DBCTRL authority
- DBADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

For implicitly created databases, the database privilege or authority can be held on the implicitly created database or on DSND04. If the DISPLAY DATABASE command is issued on specific table spaces or index spaces in an implicitly created database, ownership of the table spaces is sufficient to display status

information about them. This means that the owner can display information about an implicitly created table space or index space if the command explicitly specifies that table space or index space name.

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

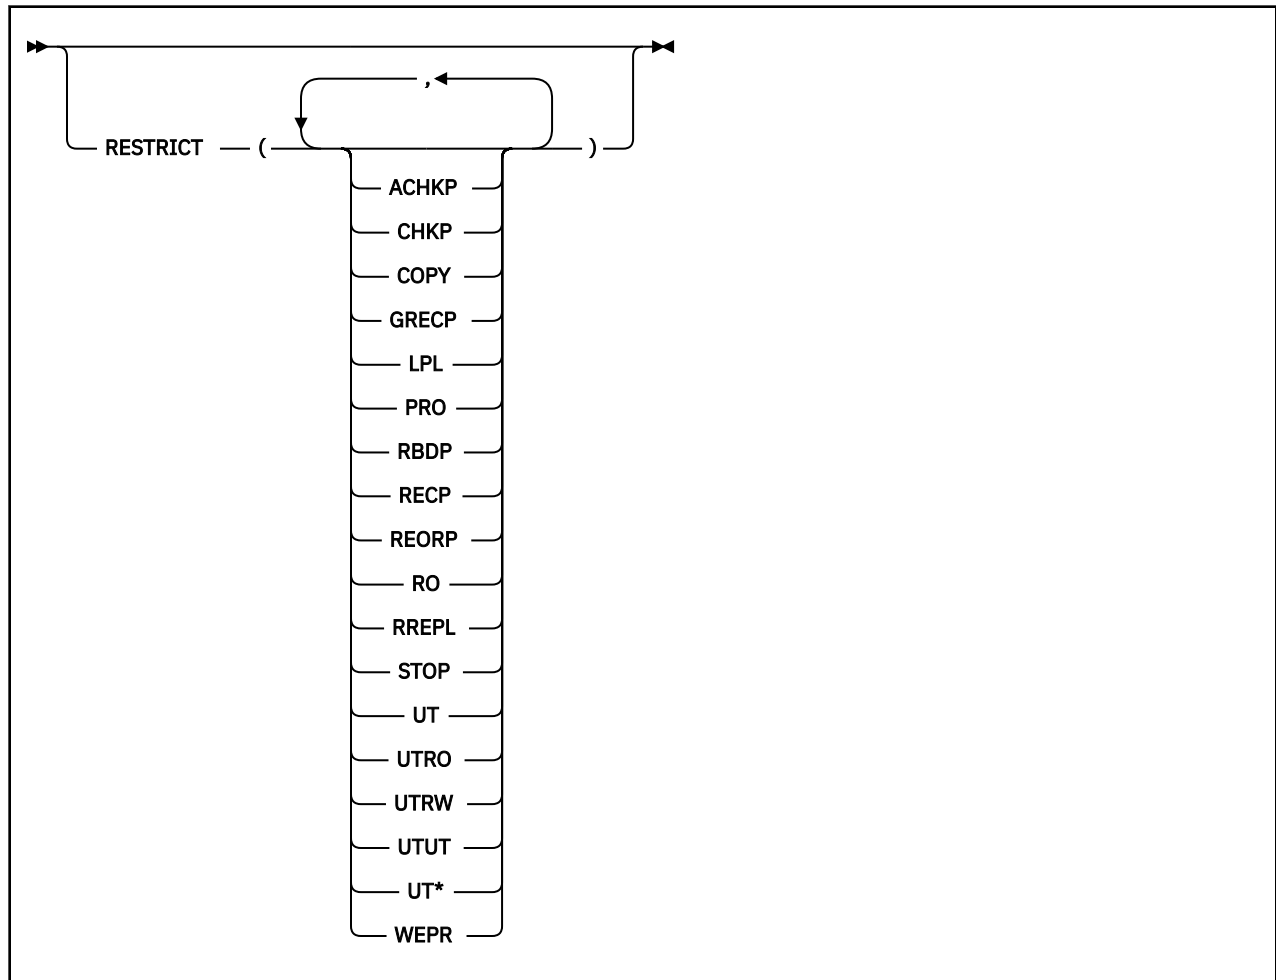

Notes:

¹ If you specify the ONLY option without the SPACENAM() keyword, only the LIMIT, AFTER, and RESTRICT keywords apply.

² The OVERVIEW keyword cannot be specified with any other keywords except SPACENAM, LIMIT, and AFTER.

³ The LRSN keyword cannot be specified with any other keywords except SPACENAM and PART. Use the LRSN keyword only under the direction of IBM Support.

restrict block:

Option descriptions

(*database-name*)

Identifies one or more databases whose status is to be displayed. The following variations are accepted:

(*database-name*, ...)

Identifies one or more database names, separated by commas or blanks.

(*)

All databases that are defined to the Db2 subsystem for which the privilege set of the process has the required authorization.

(*dbname1:dbname2*)

All databases whose names, in UNICODE, are between *dbname1* and *dbname2* inclusive.

(*dbname**)

All databases whose names begin with the string *dbname* that contains 1 - 7 characters.

(*dbname)

All databases whose names end with the string *dbname* that contains 1 - 7 characters.

(*dbname*)

All databases whose names contain the string *dbname*, where *dbname* that contains 1 - 6 characters.

(*dbstring1*dbstring2*)

All databases whose names contain the strings *dbstring1* and *dbstring2* that together contain a total of 2 - 5 characters.

SPACENAM

Specifies what space to display. If you use SPACENAM, you must also specify the corresponding database name. If (*) is used to specify multiple databases, SPACENAM(*) can be specified to display all objects in these databases.

Abbreviation: SPACE, SP

(spacename, ...)

One or more index space names, separated by commas or blanks.

(*)

All table spaces or index spaces that are defined to the Db2 subsystem for which the privilege set of the process has the required authorization.

(spacename1:spacename2)

All table spaces or index spaces whose names, in UNICODE, are between *spacename1* and *spacename2* inclusive

(spacename*)

All table spaces or index spaces whose names begin with the string *spacename* that contains 1 - 7 characters.

(*spacename)

All table spaces or index spaces whose names end with the string *spacename* that contains 1 - 7 characters.

(*spacename*)

All table spaces or index spaces whose names contain the string *spacename* that contains 1 - 6 characters.

(*spacestring1*spacestring2*)

All table spaces or index spaces whose names contain the strings *spacestring1* and *spacestring2* that together contain a total of 2 - 5 characters.

USE

Displays the following information:

- The applications and subsystems of the database or space that have internal Db2 resources allocated
- The applications and subsystems of the database or space on whose behalf locks for the space are held or waited for
- The connection IDs, correlation IDs, and authorization IDs for all applications allocated to spaces and partitions whose statuses are displayed
- The LUWID and location of any remote threads accessing the local database

CLAIMERS

Displays the following information:

- The claims on all table spaces, index spaces and partitions whose statuses are displayed
- The LUWID and location of any remote threads accessing the local database
- The connection IDs, correlation IDs, and authorization IDs for all applications allocated to spaces whose statuses are displayed
- The logical partitions that have logical claims and their associated claims

- The agent token for the claimer, if the claimer is local

CLAIMERS overrides both LOCKS and USE. If you specify CLAIMERS, any references to LOCKS or USE are ignored.

LOCKS

Displays the following information:

- The applications and subsystems on whose behalf locks are held, waited on, or retained for the database or space
- The transaction locks for all table spaces, tables, index spaces and partitions whose statuses are displayed
- The connection IDs, correlation IDs, and authorization IDs for all applications allocated to spaces whose statuses are displayed
- The LUWID and location of any remote threads accessing the local database
- The drain locks for a resource held by running jobs
- The logical partitions that have drain locks and the drain locks that are associated with them
- The retained locks for a resource
- The page set or partition physical locks (P-locks) for a resource
- The agent token for the lock holder, if the lock holder is local

LOCKS overrides USE. If both LOCKS and USE are specified, USE is ignored.

LPL

Displays logical page list entries.

WEPR

Displays write error page range information.

ONLY

Displays information about the specified object.

without SPACENAM() keyword

Displays only database information. Db2 does not display information for the spaces within the database you specified with the DISPLAY DATABASE command. If you specify ONLY, the following keywords are valid:

- RESTRICT
- LIMIT
- AFTER

with SPACENAM() keyword

Displays the table spaces or indexes that have information requested by the DISPLAY DATABASE command. If you specify SPACENAM() ONLY, you must also specify one of the following keywords:

- USE
- CLAIMERS
- LOCKS
- LPL
- WEPR

Db2 displays tables with table locks when you specify both the LOCKS and ONLY keywords.

PART (*integer* , ...)

Indicates the partition number of one or more partitions whose status is to be displayed. The *integer* specified must identify a valid partition number for the corresponding space name and database name. *integer* can be written to designate one of the following values:

- A list of one or more partitions

- A range of all partition numbers that collate greater than or equal to *integer1* and less than or equal to *integer2*
- A combination of lists and ranges

OVERVIEW

Displays each object in the database on its own line, providing an easy way to see all objects in the database.

OVERVIEW limits the display to only the space names and space types that exist in the specified databases. The number of parts is displayed for any partitioned spaces.

The OVERVIEW keyword cannot be specified with any other keywords except SPACENAM, LIMIT, and AFTER.

LIMIT

Limits the number of messages to be displayed by the command.

(*integer*)

Is the maximum number of messages that are to be displayed. The **default** is 50 . The maximum number of messages that can be displayed is limited by the space available.

(*)

Limits the display to the space available.

AFTER

Displays the following information:

- If only a database name is used, AFTER continues the display of all other databases whose names collate greater than that name.
- If SPACENAM and a table space or index space name are used, AFTER continues the display to all other table spaces or index spaces in the same database whose names collate greater than that name.

AFTER cannot be used with more than one database name, table space name, or index space name, or with any pattern-matching character (*) within a database name, table space name, or index space name.

ACTIVE

Limits the display to table spaces or index spaces that have had internal Db2 resources allocated to applications and are in a started state or to databases that contain such spaces.

Abbreviation: A

Default: Using neither ACTIVE nor RESTRICT displays information on all databases defined to Db2.

RESTRICT

Limits the display to databases, table spaces, or indexes in a restricted status. This includes those page sets that have logical page list entries. Specifying one or more keywords further limits the display to the named objects only.

Abbreviation: RES

Use of a database is restricted if the database is in any of the following situations:

- It is started for read-only processing.
- It is started for read-or-replication-only processing.
- It is started for utility-only processing.
- It is stopped.

Use of a table space or index space is restricted if the table space or index space is in any of the following situations:

- It is in one of the three situations listed previously.
- It is being processed by a utility.

- It is in COPY-pending, CHECK-pending, RECOVER-pending, group buffer pool RECOVER-pending, auxiliary CHECK-pending, or REORG-pending status.
- It contains a page error range.
- It contains pages in the logical page list (LPL).

Specify one or more of the following keywords to limit objects that are to be listed.

ACHKP

Displays objects in the auxiliary warning advisory status.

CHKP

Display objects that are in CHECK-pending status.

COPY

Display objects that are in COPY-pending status.

GRECP

Displays objects that are in group buffer pool RECOVER-pending status.

LPL

Displays logical page list entries.

PRO

Displays table space partitions that are in Persistent Read Only (PRO) restricted status.

RBDP

Displays index objects that are in REBUILD- or RECOVER-pending status. This includes the restricted statuses RBDP, RBDP*, PSRBDP, LPL, and WEPR.

RECP

Displays objects that are in RECOVER-pending status, including the restricted status RECP, RECP*, LPL, and WEPR (write error page range).

REORP

Displays objects that are in REORG-pending status.

RO

Displays objects that are in read-only mode.

RREPL

Displays objects that are in read-or-replication-only mode.

STOP

Displays objects that are stopped, including the restricted statuses STOP, STOPE, STOPP, and LSTOP.

UT

Displays objects that are in utility access mode.

UTRO

Display objects that are serialized for utility access and available for read-only access.

UTRW

Display objects that are serialized for utility access and available for read-write access.

UTUT

Displays objects that are serialized for utility access and unavailable.

UT*

Displays objects that are in any utility access mode: UT, UTRW, UTRO, or UTUT.

WEPR

Displays write error page range information.

ADVISORY

Limits the display to indexes and table spaces to which read-write access is allowed, but for which some action is recommended.

Abbreviation: ADV

Use the DISPLAY DATABASE ADVISORY command without the RESTRICT option to determine when:

- An index space is in the informational COPY-pending (ICOPY) advisory status.
- A base table space or LOB table space is in the auxiliary warning (AUXW) advisory status.
- An index space is in the REBUILD-pending (ARBDP) advisory status.
- An index space is in the REORG (AREO*) advisory status.
- A table space or an index space is in the REORG(AREOR) advisory status.

Specify one or more of the following keywords to limit the objects listed.

AUXW

Displays objects that are in the auxiliary warning advisory status.

ICOPY

Displays objects that are in the informational COPY-pending advisory status.

ARBDP

Displays objects that are in the advisory REBUILD-pending status.

AREO*

Displays objects that are in the advisory REORG-pending status.

AREOR

Displays objects that are in the advisory REORG-pending status.

LRSN

Use the LRSN option only under the direction of IBM Support. See [Db2 commands for troubleshooting \(Diagnosing Db2 problems\)](#) for details.

Usage notes

Displaying Db2 catalog tables:

You can always display the Db2 catalog tables. However, if a table space in the catalog containing information about user databases or user table spaces is stopped, those databases or table spaces cannot be displayed. Trying to display them will cause an error.

If you issue DISPLAY DATABASE LOCKS on the catalog (DSNDB06), you might see a lock held on SYSTSTSP with the correlation ID 020.DBCMD_05 or 020.DBCMD_06. This information indicates the lock that DISPLAY DATABASE itself needs and is normal.

Displaying restricted and advisory status objects:

To display all resources that are in restricted status, you must issue the DISPLAY DATABASE command twice. To display table spaces and indexes in restricted status, use the SPACENAM parameter with RESTRICT. To display databases in restricted status, do **not** use the SPACENAM parameter. Spaces could be unavailable even if they show RW mode if the database is in restricted status.

To display all resources that are in advisory status, issue the DISPLAY DATABASE ADVISORY command without the RESTRICT option.

Communications Database and Resource Limit Facility:

If the command specifies a table space or index space in the communications database or in the active resource limit facility database, the USE option displays the names of all members of the data sharing group that are using the specified table space or index space. Knowing which other members of the data sharing group might be using these spaces is useful when considering whether to drop table spaces and index spaces in the communications database and the resource limit facility database.

Displaying logical partitions:

If you issue DISPLAY DATABASE with the PART parameter for a logical partition of a type 2 index, Db2 does not display physical claimers and physical locks in the output. Nonpartitioned indexes are displayed with a type of 'IX' and with partition numbers displayed either as 'L' followed by a four-digit number, or as 'L*'. When the information for all the logical partitions is the same, partition numbers are displayed as 'L*'. If there is unique information to be displayed for a particular logical partition, L is used with that partition number to represent the logical part.

Displaying databases for declared temporary tables:

DISPLAY DATABASE can display information about databases that are created with the AS TEMP option and the associated table spaces, but does not display information for declared temporary tables or index spaces that the database contains.

Displaying data-partitioned secondary indexes (DPSIs):

DISPLAY DATABASE can display information about data-partitioned secondary indexes. DPSIs are displayed with a type of 'IX'. The partition number is displayed as 'D' followed by the four-digit partition number, ranging from 0001 to 4096.

Displaying XML table spaces:

DISPLAY DATABASE can display information about the status of XML table spaces. XML table spaces are displayed with a type of 'XS'.

Displaying clone table information:

The information about base table objects and their clones is automatically displayed if a clone table exists. The information for both base objects and clones is displayed because clone objects can have different states than their base counterparts. DISPLAY indicates the current base and clone data set instance numbers.

Base table objects that have been cloned are noted with the character 'B' in the TYPE column of the DISPLAY output. Cloned objects are noted with the character 'C' in the TYPE column. Immediately following the 'B' or 'C' character is the data set instance number. The data set number is always a '1' or '2'. All the base table objects have the same data set instance number. All of the clone table objects have the same instance number, which is different than the base table objects' instance number. Data set instance number associations change during each data exchange.

You can also query the INSTANCE column of the SYSTABLESPACE catalog table to determine the current instance number associated with a particular base table.

If you drop a cloned table of a base table with a instance number '2' then the DISPLAY output of the base table still indicates that a clone once existed. The DISPLAY command output still shows 'B2' in the TYPE column to indicate that the base object is using instance number '2'. If you drop a cloned table and the base object instance number is '1' then the DISPLAY command outputs information that does not indicate that a clone ever existed. There is no 'B' character or instance number in the TYPE column.

Output

Message [DSNT361I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Examples

Example: Displaying information about a single table space

The following command displays information about table space TBS33 in database CB3. The USE option causes *connection-name* (CONNID), *correlation-id* (CORRID), and *authorization-ID* (USERID) information to be displayed.

```
-DISPLAY DATABASE(CB3) SPACENAM(TBS33) USE
```

The output is similar to this output:

```
DSNT360I - *****
DSNT361I - *   DISPLAY DATABASE SUMMARY
          *   GLOBAL USE
DSNT360I - *****
DSNT362I -   DATABASE = CB3   STATUS = RW
          DBD LENGTH = 4028
DSNT397I -
NAME      TYPE PART   STATUS          CONNID    CORRID      USERID
-----
TBS33     TS      0001 RW          LSS001    DSN2SQL     SYSADM
  -THRU   TS      0004
TBS33     TS
```

```
***** DISPLAY OF DATABASE CB3          ENDED          *****
DSN9022I . DSNTDDIS 'DISPLAY DATABASE' NORMAL COMPLETION
```

Example: Display information about database locks

The following command display information about table space TBS33 in database CB3. The LOCKS option displays lock information for table spaces and tables specified; LUWIDs and locations of any remote threads; and *connection-name*, *correlation-id*, and *authorization ID* information.

```
-DISPLAY DATABASE(CB3) SPACENAM(TBS33) LOCKS
```

The output is similar to this output:

```
DSNT360I - *****
DSNT361I - *   DISPLAY DATABASE SUMMARY
          *   GLOBAL LOCKS
DSNT360I - *****
DSNT362I -   DATABASE = CB3  STATUS = RW
          DBD LENGTH = 4028

TBS33     TS
***** DISPLAY OF DATABASE CB3          ENDED          *****
```

Example: Displaying information about claimers

The following command displays information about table space TBS33 in database CB3. The CLAIMERS option displays claim types and durations; LUWIDs and locations of any remote threads; and *connection-name*, *correlation-id*, and *authorization ID* information.

```
-DISPLAY DATABASE(CB3) SPACENAM(TBS33) CLAIMERS
```

The output is similar to this output:

```
DSNT360I - *****
DSNT361I - *   DISPLAY DATABASE SUMMARY
          *   GLOBAL CLAIMERS
DSNT360I - *****
DSNT362I -   DATABASE = CB3  STATUS = RW
          DBD LENGTH = 4028
DSNT397I -

TBS33     TS      0004 RW              LSS001   DSN2SQL     (RR,C)
TBS33     TS      0004 RW              LSS001   DSN2SQL     (WR,C)
TBS33     TS
***** DISPLAY OF DATABASE CB3          ENDED          *****
```

Example: Displaying information about locks in a data sharing environment

The following command displays information about locks that are held for a table space. The database is in a data sharing environment. The application that is identified as LSS001 on member DB1G has locked partitions 1 and 2. LSS002 on member DB2G has locked partitions 1 and 3. Partition 4 has no locks held on it.

```
-DISPLAY DATABASE(DSN8D12A) SPACENAM(TSPART) LOCKS
```

The output is similar to this output:

NAME	TYPE	PART	STATUS	CONNID	CORRID	LOCKINFO
TSPART	TS	0001	RO	LSS001	DSN2SQL	H-IS,P,C
-			MEMBER NAME DB1G			
TSPART	TS	0001	RO			H-S,PP,I
-			MEMBER NAME DB1G			

TSPART	TS	0001	RO		LSS002	DSN2SQL	H-IS,P,C
-	-	-	-	MEMBER NAME	DB2G		
TSPART	TS	0001	RO				H-S,PP,I
-	-	-	-	MEMBER NAME	DB2G		
TSPART	TS	0002	RW		LSS001	DSN2SQL	H-IS,P,C
-	-	-	-	MEMBER NAME	DB1G		
TSPART	TS	0002	RW				H-S,PP,I
-	-	-	-	MEMBER NAME	DB1G		
TSPART	TS	0003	RW		LSS002	DSN2SQL	H-IS,P,C
-	-	-	-	MEMBER NAME	DB2G		
TSPART	TS	0003	RW				H-S,PP,I
-	-	-	-	MEMBER NAME	DB2G		
TSPART	TS	0004	RW				
TSPART	TS						

If Db2 cannot selectively lock the partitions, it must lock all of the partitions and the display looks similar to the following output. The LOCKINFO field shows a value of S, indicating that this is a table space lock. If partitions are held in different statuses, those statuses are listed below the table space locks.

NAME	TYPE	PART	STATUS	CONNID	CORRID	LOCKINFO
TSPART	TS			LSS001	DSN2SQL	H-IS,S,C
-	-	-	MEMBER NAME	DB1G		
TSPART	TS			LSS002	DSN2SQL	H-IS,S,C
-	-	-	MEMBER NAME	DB2G		
TSPART	TS	0001	RO			H-S,PP,I
-	-	-	MEMBER NAME	DB1G		
TSPART	TS	0002	RW			H-S,PP,I
-	-	-	MEMBER NAME	DB2G		
TSPART	TS	0003	RW			H-S,PP,I
-	-	-	MEMBER NAME	DB2G		
TSPART	TS	0004	RW			
TSPART	TS					

Example: Displaying information about table spaces with entries in the logical page list

The following command displays information about table spaces in database DSNDB01 that have entries in the logical page list. The LIMIT parameter limits the number of messages displayed to the space available.

```
-DB1G DISPLAY DATABASE(DSNDB01) SPACENAM(*) LIMIT(*) LPL
```

The output is similar to this output:

```
*****
DSNT361I -DB1G * DISPLAY DATABASE SUMMARY
          * GLOBAL LPL
DSNT360I -DB1G
*****
DSNT362I -DB1G DATABASE = DSNDB01 STATUS = RW
          DBD LENGTH = 8000

DSNLLX02  IX        RW
***** DISPLAY OF DATABASE DSNDB01 ENDED *****
DSN9022I -DB1G DSNTDDIS 'DISPLAY DATABASE' NORMAL COMPLETION
```

Example: Displaying lock information for partitions in a table space when Db2 cannot do selective partition locking

Suppose that Db2 is unable to selectively lock the partitions of table space TSPART, which is in database DSN8D12A. When you specify the following command, two applications are accessing TSPART, and the partitions have different statuses.

```
-DB1G DISPLAY DATABASE(DSN8D12A) SPACE(TSPART) PART(1,4) LOCKS
```

Db2 displays the locks as table space locks, as shown in the following output:

NAME	TYPE	PART	STATUS	CONNID	CORRID	LOCKINFO
TSPART	TS			LSS001	DSN2SQL	H-IS,S,C
TSPART	TS			LSS002	DSN2SQL	H-IS,S,C
TSPART	TS	0001	RO			
TSPART	TS	0004	RW			

Example: Displaying lock information for partitions in a table space when Db2 can do selective partition locking

Suppose that you have executed the ALTER TABLESPACE statement on table space TSPART so that TSPART is now defined with LOCKPART YES. LOCKPART YES causes Db2 to do selective partition locking on TSPART. When you issue the following command, two applications are accessing TSPART. The application identified by connection ID LSS001 has locked partitions 1 and 2. The application identified by connection ID LSS002 has locked partitions 1 and 3.

```
-DB1G DISPLAY DATABASE(DSN8D12A) SPACE(TSPART) PART(1:4) LOCKS
```

Db2 displays the locks as partition locks, as shown in the following output:

NAME	TYPE	PART	STATUS	CONNID	CORRID	LOCKINFO
TSPART	TS	0001	RO	LSS001	DSN2SQL	H-IS,P,C
TSPART	TS	0001	RO	LSS002	DSN2SQL	H-IS,P,C
TSPART	TS	0002	RW	LSS001	DSN2SQL	H-IS,P,C
TSPART	TS	0003	RW	LSS002	DSN2SQL	H-IS,P,C
TSPART	TS	0004	RW			

Example: Displaying information about table spaces and index spaces that are in a restrictive status

The following command displays information about all table spaces and index spaces in the range of databases from DBKD0101 to DBKD0106 that are in a restrictive status. The LIMIT parameter limits the number of messages that are displayed to the available space.

```
-DISPLAY DATABASE(DBKD0101,DBKD0103) SPACENAM(*) RESTRICT LIMIT(*)
```

The output is similar to this output:

```

DSNT360I - *****
DSNT361I - *   DISPLAY DATABASE SUMMARY
          *   RESTRICTED
DSNT360I - *****
DSNT362I -   DATABASE = DBKD0101  STATUS = RW
          DBD LENGTH = 4028
DSNT397I -
NAME      TYPE  PART   STATUS                PHYERRLO PHYERRHI CATALOG  PIECE
-----
TLKD0101 TS                RW,RESTP
IUKD011A IX                RW,RESTP

Chapter 23. -DISPLAY DDF (Db2)

The DISPLAY DDF command displays information regarding the status and configuration of DDF, as well as statistical information regarding connections or threads controlled by DDF.

Abbreviation: -DIS DDF

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- DISPLAY privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

ALIAS(alias-name)

Displays information specific to the DDF location alias specified by *alias-name*.

DETAIL

Displays additional statistics and configuration information.

Output

Message [DSNL080I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Examples

Example: Displaying a detailed DDF report when DDF has not been started

Suppose that DDF has not been started. The following command displays a DDF detail report:

```
-DISPLAY DDF DETAIL
```

The output is similar to this output:

```
DSNL081I STATUS=STOPDQ
DSNL082I LOCATION          LUNAME          GENERICLU
DSNL083I STLEC1            -NONE.SYEC1DB2  -NONE

Chapter 24. -DISPLAY DYNQUERYCAPTURE (Db2)

The Db2 command DISPLAY DYNQUERYCAPTURE displays all currently active dynamic query capture monitors.

Abbreviation: -DIS DYNQUERY

Environment

This command can be issued from the z/OS console, through a batch job, or the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Syntax

➤ DISPLAY DYNQUERYCAPTURE

Option descriptions

CNO(integer)

Limit display to a particular capture monitor, a list of capture monitors, or display all capture monitors.

Display all active capture monitors.

integer

Display the specified active capture monitors.

Example: displaying all active capture monitors for dynamic queries

Suppose that you issue the following command:

```
-DISPLAY DYNQUERYCAPTURE CNO (*)
```

The output is similar to the following output:

```
DSNX250I -DB2A DSNXEDQC 215
*** BEGIN DISPLAY DYNAMIC QUERY CAPTURE CNO(*)
=====
CNO : 1
STBLGRP : GRP1
```

```

SQLID : APPL01

-----
CNO : 5
STBLGRP : GRP2
SQLID : APPL02
THRESHOLD : 30
STABILIZED : 47
-----
...
CNO : 51
STBLGRP : GRP126
SQLID : APPL126
THRESHOLD : 9
>>> MORE TO DISPLAY ...
DSNX260I -DB2A DISPLAY DYNAMIC QUERY CAPTURE CONTINUES
STABILIZED : 13
-----
CNO : 52
STBLGRP : GRP127
SQLID : APPL127
THRESHOLD : 50
STABILIZED : 2
=====
*** END DISPLAY DYNAMIC QUERY CAPTURE
DSN9022I -DB2A DSNXEDQC 'DISPLAY DYNQUERYCAPTURE' NORMAL COMPLETION

```

Output

Message [DSNX250I](#) indicates the beginning of the output of the command.

Message [DSNX260I](#) indicates that a long display output continues from the previous output.

Message [DSN9022I](#) indicates successful completion of processing for the DISPLAY DYNQUERYCAPTURE command.

Message [DSN9023I](#) indicates that processing for the DISPLAY DYNQUERYCAPTURE did not complete successfully.

Related tasks

[Stabilizing access paths for dynamic SQL statements \(Db2 Performance\)](#)

Related reference

[-START DYNQUERYCAPTURE \(Db2\)](#)

The Db2 command START DYNQUERYCAPTURE stabilizes access paths for qualified cached dynamic queries. This command can also optionally start monitoring of cached dynamic queries that qualify for a scope but have not met the specified execution threshold for stabilization.

[-STOP DYNQUERYCAPTURE \(Db2\)](#)

The Db2 command STOP DYNQUERYCAPTURE stops the capture of dynamic SQL statements by the specified monitors.

[FREE STABILIZED DYNAMIC QUERY \(DSN\)](#)

The DSN subcommand FREE STABILIZED DYNAMIC QUERY removes from certain catalog tables one or more stabilized dynamic queries. If any of the specified queries are in the dynamic statement cache, FREE STABILIZED DYNAMIC QUERY purges the statements from the dynamic statement cache.

Chapter 25. -DISPLAY FUNCTION SPECIFIC (Db2)

The Db2 command DISPLAY FUNCTION SPECIFIC displays statistics about external user-defined functions that Db2 applications access.

Abbreviation: -DIS FUNC SPEC

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the value of the SCOPE option.

Authorization

To run this command, you must use a privilege set of the process that includes one of the following authorities for each function:

- DISPLAY privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

If you specify DISPLAY FUNCTION SPECIFIC *.* or *schema.partial-name **, you must use a privilege set of the process that includes one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

If you are using an external security product to authorize usage of DISPLAY FUNCTION SPECIFIC, define SYSOPR as a user to the external security product for those cases in which DISPLAY FUNCTION SPECIFIC SCOPE(GROUP) runs on a remote system and SYSOPR is used as the authorization ID.

Syntax

Option descriptions

schema.specific-function-name

Displays information for the specific named function in the specified schema. You cannot specify a function name as you can in SQL; you must use the specific name. If a specific name was not specified on the CREATE FUNCTION statement, query SYSIBM.SYSROUTINES for the correct specific name:

```
SELECT SPECIFICNAME, PARM_COUNT
FROM SYSIBM.SYSROUTINES
WHERE NAME='function_name'
AND SCHEMA='schema_name';
```

For overloaded functions, this query can return multiple rows.

schema.partial-name*

Displays information for a set of functions in the specified schema.

The specific names of all functions in the set begin with *partial-name* and can end with any string, including the empty string. For example, schema1.ABC* displays information for all functions with specific names that begin with ABC in schema1.

(*.*)

Displays information for all functions that Db2 applications have accessed since the Db2 subsystem was started.

SCOPE

Specifies the scope of the command.

(LOCAL)

Specifies that the display includes information from only the local member.

(GROUP)

Specifies that the display includes information from all members of the data sharing group.

Usage notes

Displaying information for all functions: If you do not specify a partial or specific function name, Db2 displays information for all functions that Db2 applications have accessed since the Db2 subsystem was started.

Built-in functions or user-defined functions that are sourced on another function: This command does not apply to built-in functions or user-defined functions that are sourced on another function.

Displaying SQL functions: SQL functions are displayed in the DISPLAY FUNCTION SPECIFIC output only if you invoke the function in debug mode. In that case, the WLM environment column in the output contains the WLM environment that you specified for debugging when you created the SQL function.

The DISPLAY FUNCTION output shows the statistics on an SQL function as '0' if the function is under the effect of a STOP FUNCTION command.

Output

Message [DSNX975I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Examples

Example: Displaying information about all user-defined functions in a schema

The following command displays information about all functions in the PAYROLL schema and the HRPROD schema.

```
-DISPLAY FUNCTION SPECIFIC(PAYROLL.*, HRPROD.*)
```

The output is similar to the following output:

```
DSNX975I = DSNX9DIS DISPLAY FUNCTION SPECIFIC REPORT FOLLOWS-
----- SCHEMA=PAYROLL
FUNCTION      STATUS      ACTIVE   QUED    MAXQ    TIMEOUT  FAIL    WLM_ENV
PAYRFNC1     STARTED      0        0        1        0        0      WLMENV1
PAYRFNC2     STOPQUE      0        5        5        3        0      WLMENV1
PAYRFNC3     STARTED      2        0        6        0        0      WLMENV1
USERFNC4     STOPREJ      0        0        1        0        0      WLMENV3

----- SCHEMA=HRPROD
FUNCTION      STATUS      ACTIVE   QUED    MAXQ    TIMEOUT  FAIL    WLM_ENV
HRFNC1       STARTED      0        0        1        0        0      WLMENV2
HRFNC2       STOPREJ      0        0        1        0        0      WLMENV2
DSNX9DIS DISPLAY FUNCTION SPECIFIC REPORT COMPLETE
DSN9022I = DSNX9COM '-DISPLAY FUNC' NORMAL COMPLETION
```

Example: Displaying information about selected user-defined functions in a schema

The following command displays information about functions USERFNC2 and USERFNC4 in the PAYROLL schema.

```
-DISPLAY FUNCTION SPECIFIC(PAYROLL.USERFNC2,PAYROLL.USERFNC4)
```

The output is similar to the following output:

```
DSNX975I = DSNX9DIS DISPLAY FUNCTION SPECIFIC REPORT FOLLOWS-
----- SCHEMA=PAYROLL
FUNCTION      STATUS      ACTIVE   QUED    MAXQ    TIMEOUT  FAIL    WLM_ENV
USERFNC2     STOPQUE      0        5        5        3        0      WLMENV3
USERFNC4     STOPREJ      0        0        1        0        0      WLMENV3
DSNX9DIS DISPLAY FUNCTION SPECIFIC REPORT COMPLETE
DSN9022I = DSNX9COM '-DISPLAY FUNC' NORMAL COMPLETION
```

Example: Displaying information about stopped user-defined functions

Suppose that you issue the following commands:

```
-STOP FUNCTION SPECIFIC(SYSADM.FN*) ACTION(QUEUE)
-DISPLAY FUNCTION SPECIFIC(SYSADM.*)
```

The output looks similar to the following output:

```
DSNX975I = DSNX9DIS DISPLAY FUNCTION SPECIFIC REPORT FOLLOWS-
----- SCHEMA=SYSADM
FUNCTION      STATUS      ACTIVE   QUED    MAXQ    TIMEOUT  FAIL    WLM_ENV
FNC1         STOPQUE      0        0        0        0        0      WLMENV1
FNC2         STOPQUE      0        0        0        0        0      WLMENV3
DSNX9DIS FUNCTIONS FN - FN* STOP QUEUE
DSNX9DIS DISPLAY FUNCTION SPECIFIC REPORT COMPLETE
DSN9022I = DSNX9COM '-DISPLAY FUNC' NORMAL COMPLETION
```

Chapter 26. -DISPLAY GROUP (Db2)

The Db2 command DISPLAY GROUP displays information about the data sharing group to which a Db2 subsystem belongs, including information about the code level, catalog level, and function level of the group.

DISPLAY GROUP DETAIL displays information about the Db2 subsystem and data sharing group members.

Abbreviation: -DIS GROUP

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member, Group (for ENCRYPTION_KEYLABEL)

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- DISPLAY privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

DETAIL

Displays information about the current inline length of the LOB that contains bound package information.

Usage notes

Member status: Message DSN7100I includes information about the XCF status of the members (STATUS in the display output). The status can be ACTIVE, QUIESCED, FAILED, or DEACT.

ACTIVE

Indicates that the Db2 subsystem is active.

FAILED

Indicates that the Db2 subsystem is failed.

DEACT

Indicates that the Db2 subsystem is deactivated. Deactivation is the first step in the process of deleting a data sharing member.

QUIESCED

Indicates a normal quiesced state, as the result of a normal STOP DB2 command.

Q

Q (quiesced) can be paired with one or more of the following letters:

I

Indoubt or postponed abort units of recovery (URs) are outstanding. This means that retained locks are held.

C

The member was shut down without completing castout processing. This event might have occurred because Db2 was started with the LIGHT(YES) option or stopped with the CASTOUT(NO) option, or because an error was encountered while attempting to cast out data from the coupling facility to the disk.

If Db2 encounters errors during castout processing, ensure that no connectivity problems exist between the coupling facility and the processor before restarting Db2.

R

Retained information is needed for Db2 to perform resynchronization with one or more remote locations.

When Db2 is restarted, this resynchronization occurs.

ACTIVE

Indicates a normal active state without conditions.

A

The member is active, but with the additional conditions. A (active) can be paired with the following letter:

I

Indoubt or postponed abort units of recovery (URs) are outstanding. This indicates that retained locks are held.

Using this command in a non-data-sharing environment: Db2 issues the same response, except for information which does not exist: group name, member name, and member ID.

Examples

The following examples show output from DISPLAY GROUP commands:

```
-DB1A DISPLAY GROUP DETAIL
```

Example: Data sharing group with coexisting Db2 12 and Db2 11

```
-DISPLAY GROUP DETAIL

FL 502 Example: Data sharing group with an encryption key label assigned to all members

If the subsystem parameter ENCRYPTION_KEYLABEL is specified for the members of a data sharing group, issue the following command to display the key label:

```
-DISPLAY GROUP DETAIL
```

The output is similar to the following:

```

DSN7100I -DB2C DSN7GCMD
*** BEGIN DISPLAY OF GROUP(DSNCAT ) CATALOG LEVEL(V12R1M502)

Chapter 27. -DISPLAY GROUPBUFFERPOOL (Db2)

The Db2 command DISPLAY GROUPBUFFERPOOL displays information about the status of Db2 group buffer pools. It can also display related statistics.

Abbreviation

-DIS GBPOOL

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group

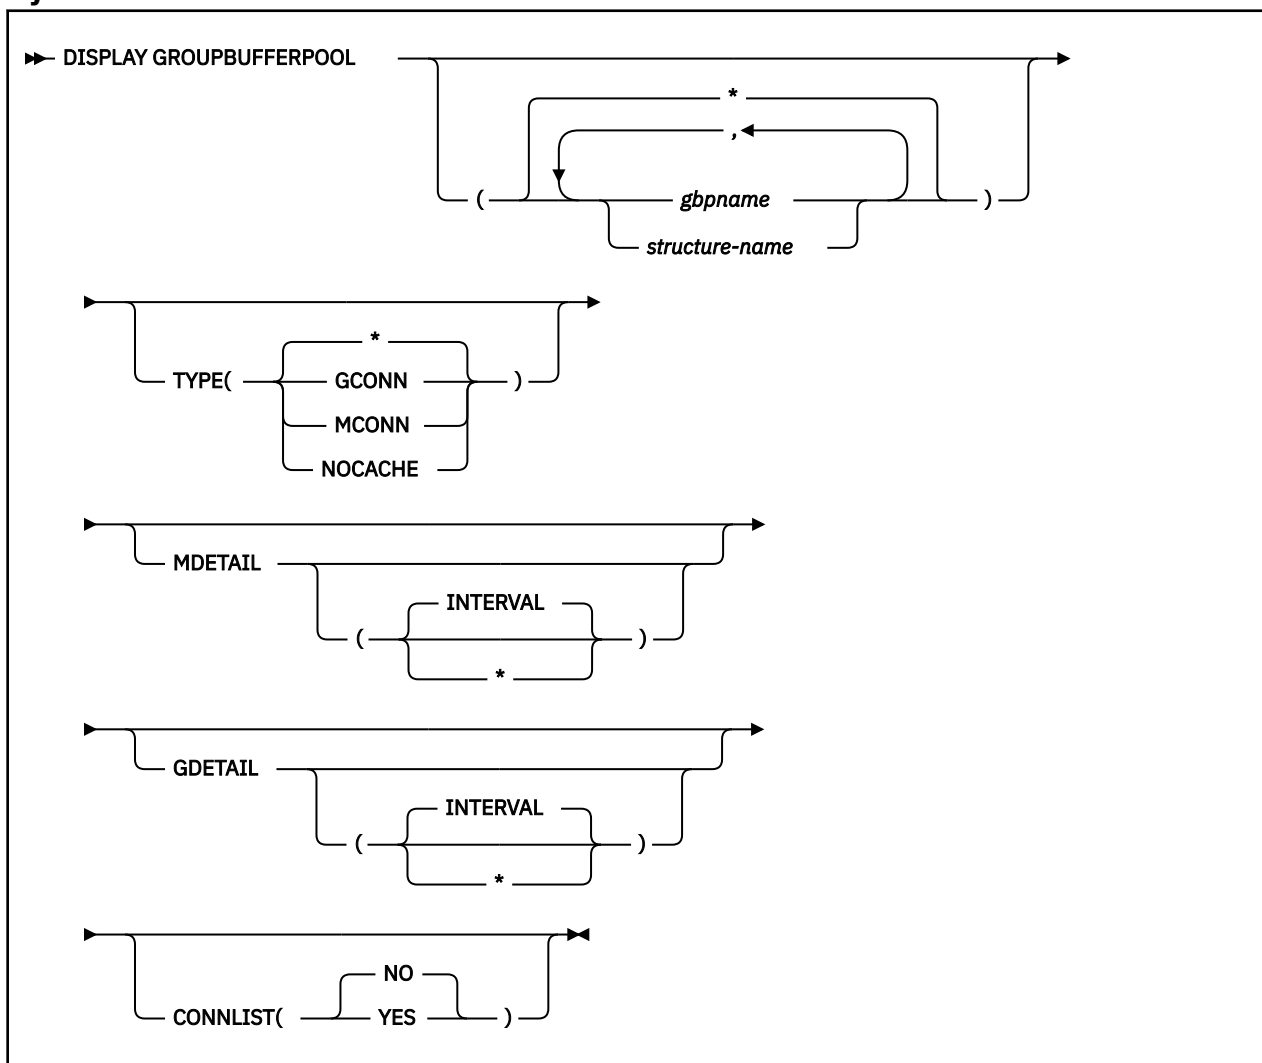

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- DISPLAY system privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option description

(*)

Displays the group buffer pool status for all group buffer pools.

(gbpname)

Names the group buffer pool for which status is to be displayed.

- 4-KB group buffer pools are named GBP0 through GBP49
- 8-KB group buffer pools are named GBP8K0 through GBP8K9
- 16-KB group buffer pools are named GBP16K0 through GBP16K9
- 32-KB group buffer pools are named GBP32K through GBP32K9

(structure-name)

Names the backing coupling facility structure for the group buffer pool. The coupling facility structure name has the following format:

```

groupname
_gbpname
  
```

where *groupname* is the Db2 data sharing group name and the underscore (`_`) separates *groupname* and *gbpname* .

TYPE

Indicates the type of group buffer pools (among those that are specified) for which information is displayed.

(*)

All group buffer pools are specified. This is the default.

(GCONN)

Group buffer pools that are currently connected to any member of the data sharing group. The connection can be "active" or "failed-persistent".

(MCONN)

Group buffer pools that are currently connected to the member to which the command is directed.

(NOCACHE)

Group buffer pools that have the GBPCACHE attribute set to NO.

MDETAIL

Shows a detailed statistical report for the specified group buffer pools, reflecting the member's activity for each group buffer pool. If the member to which the command is directed has never been actively connected to the group buffer pool, no detail report is shown.

(INTERVAL)

Shows incremental statistics. The values displayed are accumulated since the last MDETAIL(INTERVAL) report for this member, if there was one. This is the default.

(*)

Shows cumulative statistics. The values displayed are accumulated since this member first connected to the group buffer pool.

GDETAIL

Shows a detailed statistical report for the specified group buffer pools, reflecting the activity of the entire group for each group buffer pool. If the member to which the command is directed is not actively connected to the group buffer pool, no detail report is shown.

(INTERVAL)

Shows incremental statistics. The values displayed are accumulated since the last GDETAIL(INTERVAL) report, if there was one. This is the default.

(*)

Shows cumulative statistics. The values displayed are accumulated since the group buffer pool was most recently allocated or reallocated.

CONNLIST

Specifies whether a connection list report is shown for the specified group buffer pools, listing the connection names of the subsystems that are currently connected to the group buffer pools and their connection status.

(NO)

Do not show the connection list report.

(YES)

Show the connection list report.

Output

Message [DSNB750I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Examples

Example: Displaying a group buffer pool summary report

Issue the following command to issue a summary report for group buffer pool GBP29:

```
-DISPLAY GROUPBUFFERPOOL(GBP29)
```

The output is similar to this output. Message DSNB799I is displayed if the group buffer pool is duplexed and the secondary group buffer pool is currently allocated. If a secondary group buffer pool is not allocated, message DSNB799I is not included in the output.

Chapter 28. -DISPLAY LOCATION (Db2)

The Db2 command DISPLAY LOCATION displays various information about the specified remote locations.

When you specify the DETAIL keyword, information about the numbers of connections with partner locations that have particular attributes are shown, and detailed information about connections owned by Db2 system threads that are communicating with the location might also be shown for each partner location.

The information returned by the DISPLAY LOCATION command reflects a dynamic status. By the time the information is displayed, it is possible that the status has changed.

Abbreviation: -DIS LOC

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

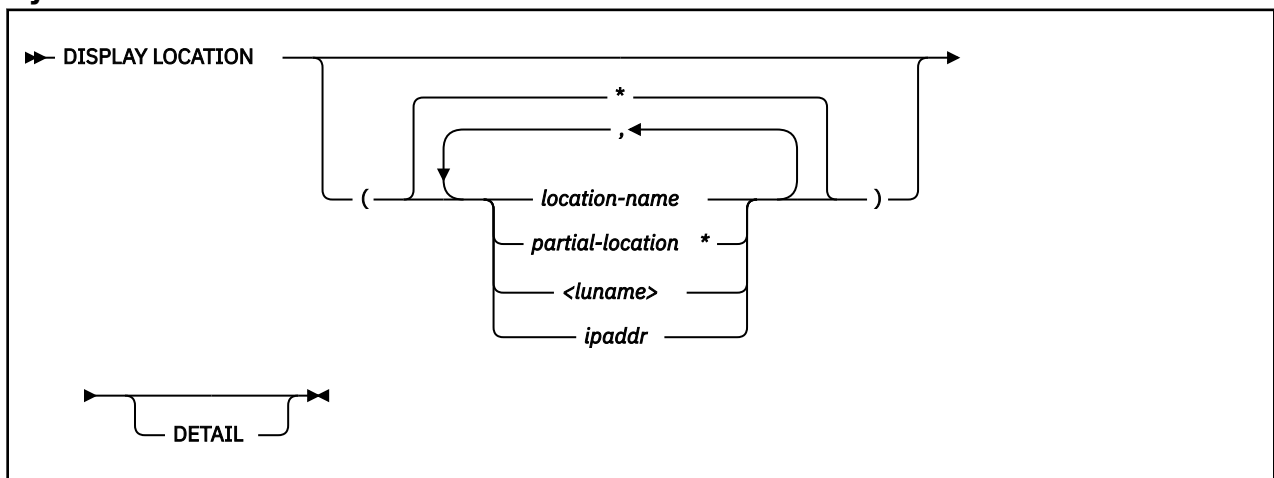

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- DISPLAY system privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

(*)

Displays information for all remote locations.

(location-name)

Lists one or more location names, separated by commas.

Because Db2 does not receive a location name from requesters that are not Db2 for z/OS subsystems, you can enter the LUNAME or IP address of such a requester. Refer to the option descriptions for the **< luname >** and **(ipaddr)** options for more information about using the LUNAME or IP address to specify a requester that is not a Db2 for z/OS subsystem.

(partial-location *)

Selects all location names that begin with the string *partial-location* and can end with any string, including the empty string. For example, LOCATION(ABC*) selects all location names that begin with the string 'ABC'.

< luname >

Requests information about the remote clients that are connected to DDF through the remote SNA LU that is specified. Enclose the LU name in the less-than (<) and greater-than (>) symbols. For example, DISPLAY LOCATION(<LULA>) displays information about a remote location (that is not Db2 for z/OS) with the LU name of LULA.

You can use an asterisk (*) when specifying an LU name in the same manner as previously described for specifying a partial-location name. For example, DISPLAY LOCATION(<LULA*) selects all remote locations (that are not Db2 for z/OS) with an LU name that begins with the string 'LULA'.

(ipaddr)

Requests information about the clients that are connected to DDF through the remote TCP/IP host. Enter the IP address. For example, DISPLAY LOCATION(::FFFF:124.63.51.17) displays information about clients at the remote TCP/IP host whose dotted decimal IP address is 124.63.51.17.

DETAIL

Displays additional information about conversation activity for Db2 system threads.

Output

Message [DSNL200I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Examples

Example: Displaying information about threads and conversations with specific remote locations

The following command displays information about threads and conversations with remote locations LUND1, LUND2, and LUND3.

```
DISPLAY LOCATION(LUND1,LUND2,LUND3)
```

The output looks similar to this output:

```
DSNL200I  @ DISPLAY LOCATION REPORT FOLLOWS-
LOCATION
LUND1      PRDID      T ATT CONNS
LUND2      DSN12015 R      1
LUND2      DSN12015 R      1
LUND2      DSN12015 S      1
LUND3      DSN12015 R      1
LUND3      DSN12015 S      3
DISPLAY LOCATION REPORT COMPLETE
```

Example: Displaying information about conversations and threads with all remote locations

The following command displays detailed information about conversations with all remote locations, and detail conversation information about Db2 system threads that communicate with other locations.

```
-DISPLAY LOCATION DETAIL
```

```

DSNL200I  @ DISPLAY LOCATION REPORT FOLLOWS-
DSNL200I  @ DISPLAY LOCATION REPORT FOLLOWS-
LOCATION                                PRDID      T ATT CONNS

  L204-RESYNC       E15FDE02D310FB88 W R 0820914411188
  L204-RESYNC       E15FDE02D310FB89 W R 0820914411189

DISPLAY LOCATION REPORT COMPLETE
DISPLAY LOCATION REPORT COMPLETE

```

Suppose that a Db2 system is connected with the following DRDA partners:

- The output from the following command shows information about those DRDA partners:

The output is similar to the following output:

Suppose that there is trusted connection to location ::FFFF:9.30.115.135. You issue the following command:

A value of TRS in the ATT field indicates that a connection is trusted, as shown in the following example:

Suppose that a distributed application is using enhanced continuous block fetch to access data on a server. The requester has opened a secondary connection for each cursor in the application. You issue the following command at the server:

Chapter 28. -DISPLAY LOCATION (Db2) **237**

The following output is displayed:

```
DSNL200I  -DB2A DISPLAY LOCATION REPORT FOLLOWS-
LOCATION                                PRDID    T ATT CONNS
::FFFF:127.0.0.1                      DSN12015 S      1
                                         CBF      1
DISPLAY LOCATION REPORT COMPLETE
```

A value of CBF in the ATT field indicates that the thread from location ::FFFF:127.0.0.1 is associated with a secondary connection.

If you enter the same command at the requester, the following output is displayed:

```
DSNL200I  -DB2B DISPLAY LOCATION REPORT FOLLOWS-
LOCATION                                PRDID    T ATT CONNS
::FFFF:127.0.0.1..446                DSN12015 R      1
                                         CBF      1
DISPLAY LOCATION REPORT COMPLETE
```

A value of CBF in the ATT field indicates that the thread to location ::FFFF:127.0.0.1..446 is associated with a secondary connection.

Example: Display location information. The remote location is a Db2 Connect server gateway:

You issue the following command at the server:

```
-DB2A DIS LOC
```

The following output is displayed:

```
DSNL200I  -DB2A DISPLAY LOCATION REPORT FOLLOWS-
LOCATION                                PRDID    T ATT CONNS
::FFFF:9.23.2.248                    SQL09019 G      1
DISPLAY LOCATION REPORT COMPLETE
```

The location in the report has a G value in the T column when the PRDID value begins with "SQL" and the client has indicated to Db2 for z/OS that it is a Db2 Connect server gateway.

Example: Display location information. The remote location is a Db2 for z/OS subsystem that reports a functional level:

You issue the following command at the server:

```
-DB2A DIS LOC
```

The following output is displayed:

```
DSNL200I  -DB2A DISPLAY LOCATION REPORT FOLLOWS-
LOCATION                                PRDID    T ATT CONNS
SYEC1B                               DSN12015 S      1
L209-FUNCTIONAL LEVEL=V12R1M500
DISPLAY LOCATION REPORT COMPLETE
```

The functional level is the same as the application compatibility level of the requester, in the format V12R1Mnnn.

Example: Display location information. The remote location uses an IBM Data Server Driver for JDBC and SQLJ that reports a functional level:

You issue the following command at the server:

```
-DB2A DIS LOC
```

The following output is displayed:

```
DSNL200I  -DB2A DISPLAY LOCATION REPORT FOLLOWS-
LOCATION                                PRDID    T ATT CONNS
::FFFF:9.30.222.67                   JCC04220 S      1
L209-FUNCTIONAL LEVEL=29
DISPLAY LOCATION REPORT COMPLETE
```

The IBM Data Server Driver for JDBC and SQLJ version is in the form *major-version.minor-version.build-number*. The functional level is *build-number*. In this example, the driver version is 4.22.29, so the functional level is 29.

Example: Display location information. The remote location uses an IBM Data Server Driver for CLI and ODBC that reports a functional level:

You issue the following command at the server:

```
-DB2A DIS LOC
```

The following output is displayed:

```
DSNL200I  -DB2A DISPLAY LOCATION REPORT FOLLOWS-
LOCATION                                PRDID    T ATT CONNS
::FFFF:9.30.222.67                    SQL11010 S          1
L209-FUNCTIONAL
LEVEL=S1612011300
DISPLAY LOCATION REPORT COMPLETE
```

The functional level is the build level for the Db2 for Linux, UNIX, and Windows client.

Chapter 29. -DISPLAY LOG (Db2)

The Db2 command DISPLAY LOG displays log information about, and the status of, the offload task.

Abbreviation: DIS LOG

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- DISPLAY system privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

➤ DISPLAY LOG ➤

Usage notes

Information provided by the DISPLAY LOG command : You can use the DISPLAY LOG command to view the current checkpoint scheduling parameters and information about the current active log data sets and status of the offload task. You can obtain additional information about log data sets and checkpoint information by using the Print Log Map utility (DSNJU004).

Output

Message [DSNJ370I](#) (Db2 Messages) indicates the beginning of the output of the command.

Examples

Example: Displaying log information

The following command displays information about the log and the status of any offload tasks.

```
-DISPLAY LOG
```

The output is similar to the following output:

```
DSNJ370I - DSNJC00A LOG DISPLAY
CURRENT COPY1 LOG = DSN111.DB2A.LOGCOPY1.DS03 IS 70% FULL
CURRENT COPY2 LOG = INACTIVE IS 0% FULL
H/W RBA = 00000000000028B54C5C
```

```

H/O RBA = 000000000000000000
FULL LOGS TO OFFLOAD = 0 OF 3
OFFLOAD TASK IS (AVAILABLE)
SOFTWARE ACCELERATION IS ENABLED
ZHYPERLINK WRITE IS ENABLED
      LAST LOG WRITE FOR COPY1 USED ZHYPERLINK
DSNJ371I  - DB2 RESTARTED 14:18:26 SEP 12, 2018
          RESTART RBA 00000000000028B50000
          CHECKPOINT FREQUENCY 1000 LOGRECORDS
          LAST SYSTEM CHECKPOINT TAKEN 14:18:33 SEP 12, 2018
DSNJ9022I - DSNJC001 '-DIS LOG' NORMAL COMPLETION

```

The output provides the following information:

- The COPY1 active log data set is 70% full. If you are running dual logs and the percentages are different, the log data sets are of different sizes. Db2 switches both active logs when one reaches the end of the file. This can result in unused active log space if one log data set is larger than the other.
- Db2 was started at 14:18:26 on September 12, 2018, and began logging at RBA 00000000000028B50000.
- Software acceleration is enabled for peer-to-peer remote copy.
- Db2 zparm ZHYPERLINK is enabled for active logs.
- If the ZHYPERLINK Db2 system parameter is set to ENABLE or ACTIVELOG, DFSMS does a zhyperwrite implicitly, even if the REMOTE_COPY_SW_ACCEL Db2 system parameter is not enabled.
- Last log write for COPY1 was done successfully using zHyperLink. To use zHyperLink Write for Db2, make sure that Db2 zparm ZHYPERLINK=ENABLE or ZHYPERLINK=ACTIVELOG and all the other hardware and DFSMS requirements are applied.

Example: Displaying log information in a GDPS® Continuous Availability with zero data loss (GDPS Continuous Availability with zero data loss) environment

Issue -DISPLAY LOG on a member of the source data sharing group in a GDPS Continuous Availability with zero data loss environment. Output like this is displayed. Message DSNJ375I indicates that the compression dictionary data set (CDDS) is in source mode.

```

DSNJ370I  - DSNJC00A LOG DISPLAY
CURRENT COPY1 LOG = DSNC000.DB2A.LOGCOPY1.DS02 IS 1% FULL
CURRENT COPY2 LOG = INACTIVE IS 0% FULL
          H/W RBA = 000000000000471C3CD0
          H/O RBA = 000000000000000000
          FULL LOGS TO OFFLOAD = 0 OF 3
          OFFLOAD TASK IS (AVAILABLE)
          SOFTWARE ACCELERATION IS DISABLED
          ZHYPERLINK WRITE IS ENABLED
      LAST LOG WRITE FOR COPY1 USED ZHYPERLINK
DSNJ371I  - DB2 RESTARTED 11:22:42 DEC 28, 2018
          RESTART RBA 000000000000471B7000
          CHECKPOINT FREQUENCY 1000 LOGRECORDS
          LAST SYSTEM CHECKPOINT TAKEN 11:22:46 DEC 28, 2018
DSNJ375I  - DSNJC00A CDDS DSNAME = TEST.CDDS IS ACTIVE IN
          SOURCE MODE.
DSNJ9022I - DSNJC001 '-DIS LOG' NORMAL COMPLETION

```

Issue -DISPLAY LOG on a member of the proxy data sharing group in a GDPS Continuous Availability with zero data loss environment. Output like this is displayed. Message DSNJ375I indicates that the compression dictionary data set (CDDS) is in proxy mode.

```

DSNJ370I  - DSNJC00A LOG DISPLAY
CURRENT COPY1 LOG = DSNC000.DB2C.LOGCOPY1.DS02 IS 1% FULL
CURRENT COPY2 LOG = INACTIVE IS 0% FULL
...
DSNJ371I  - DB2 RESTARTED 11:26:13 DEC 28, 2018
          RESTART RBA 0000000000000024000
          CHECKPOINT FREQUENCY 1000 LOGRECORDS
          LAST SYSTEM CHECKPOINT TAKEN 11:26:20 DEC 28, 2018
DSNJ375I  - DSNJC00A CDDS DSNAME = TEST.CDDS IS ACTIVE IN
          PROXY MODE.
DSNJ9022I - DSNJC001 '-DIS LOG' NORMAL COMPLETION

```

FL 502 Example: Displaying log information about an encrypted data set

Output like this is displayed for encrypted log data sets:

```
-DISPLAY LOG
09.32.54 STC00178 DSNJ370I -DB2A DSNJC00A LOG DISPLAY
CURRENT COPY1 LOG = DSNC000.DB2A.LOGCOPY1.DS01 IS 27% FULL
KEY LABEL = DB2LOGKEY01
CURRENT COPY2 LOG = INACTIVE IS 0% FULL
      H/W RBA = 000000000001772F3150
      H/O RBA = 00000000000000000000
      FULL LOGS TO OFFLOAD = 0 OF 3
      OFFLOAD TASK IS (AVAILABLE)
      SOFTWARE ACCELERATION IS DISABLED
      ZHYPERLINK WRITE IS ENABLED
      LAST LOG WRITE FOR COPY1 USED ZHYPERLINK
09.32.54 STC00178 DSNJ371I -DB2A DB2 RESTARTED 10:54:54 FEB 13, 2018
      RESTART RBA 00000000000176FA7000
      CHECKPOINT FREQUENCY 1000 LOGRECORDS
      LAST SYSTEM CHECKPOINT TAKEN 06:55:04 FEB 14, 2018
09.32.54 STC00178 DSN9022I -DB2A DSNJC001 '-DIS LOG' NORMAL COMPLETION
```

Chapter 30. -DISPLAY ML (Db2)

The Db2 command DISPLAY ML displays the current status of IBM Db2 AI for z/OS.

Abbreviation: -DIS ML

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Output

Message DSNX611I indicates the beginning of the output of the command.

Syntax

```
➤➤ DISPLAY ML ➤➤
```

Examples

Example: Displaying the current status of IBM Db2 AI for z/OS

The following command displays the current status of IBM Db2 AI for z/OS.

```
-DISPLAY ML
```

When IBM Db2 AI for z/OS is inactive, the output is similar to the following output.

```
DSNX611I -DB2A DSNXODPM DISPLAY ML REPORT FOLLOWS:  
STATUS = STOPPED  
DISPLAY ML REPORT COMPLETE.  
DSN9022I -DB2A DSNXODPM 'DISPLAY ML' NORMAL COMPLETION
```

When IBM Db2 AI for z/OS is active, the output is similar to the following output.

```
-DB2ADIS ML  
DSNX611I -DB2A DSNXODPM DISPLAY ML REPORT FOLLOWS: 712  
STATUS = STARTED  
- ML Daemon > RUNNING  
- Heartbeat monitoring > RUNNING  
- Execution History Pushout > RUNNING  
- AccessPath History Pushout > RUNNING
```

```

- HV/OFNR Simple Model Training > RUNNING
- Model Statistics Pushout > RUNNING
- Performance Data Processing > RUNNING
- Cleanup Processing > RUNNING
- Regression Retraining > RUNNING
- ML Statistics Processing > RUNNING
- ML Scheduler > RUNNING
- ML Generating Metrics > RUNNING
- Distributed Connection Control > RUNNING
- DCC Aggregation > RUNNING
- - - - < ML CONNECTIVITY REPORT > - - - -
- Db2ZAI OPTIMIZER MODEL TRAINING > CONNECTED
- Db2ZAI SYSTEM ASSESSMENT SCHEDULING > CONNECTED
DISPLAY ML REPORT COMPLETE.

```

Note: An asterisk appended to RUNNING for Heartbeat monitoring, Regression Retraining, ML Scheduler, or ML Generating Metrics, indicates that there is a problem with access to the system assessment server or the Db2ZAI user interface. Talk to your Db2ZAI system administrator to resolve the issue.

Related reference

-START ML (Db2)

The Db2 command START ML starts IBM Db2 AI for z/OS.

-STOP ML (Db2)

The Db2 command STOP ML stops the IBM Db2 AI for z/OS if it is already been started

Related information

[DSNX611I \(Db2 Messages\)](#)

Chapter 31. -DISPLAY PROCEDURE (Db2)

The Db2 command DISPLAY PROCEDURE displays statistics about stored procedures that are accessed by Db2 applications.

This command displays one line of output for each stored procedure that a Db2 application has accessed. You can qualify stored procedure names with a schema name.

The information returned by the DISPLAY PROCEDURE command reflects a dynamic status. By the time the information is displayed, it is possible that the status could have changed.

Abbreviation: -DIS PROC

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or a CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the value of the SCOPE option.

Authorization

To run this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- DISPLAY system privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

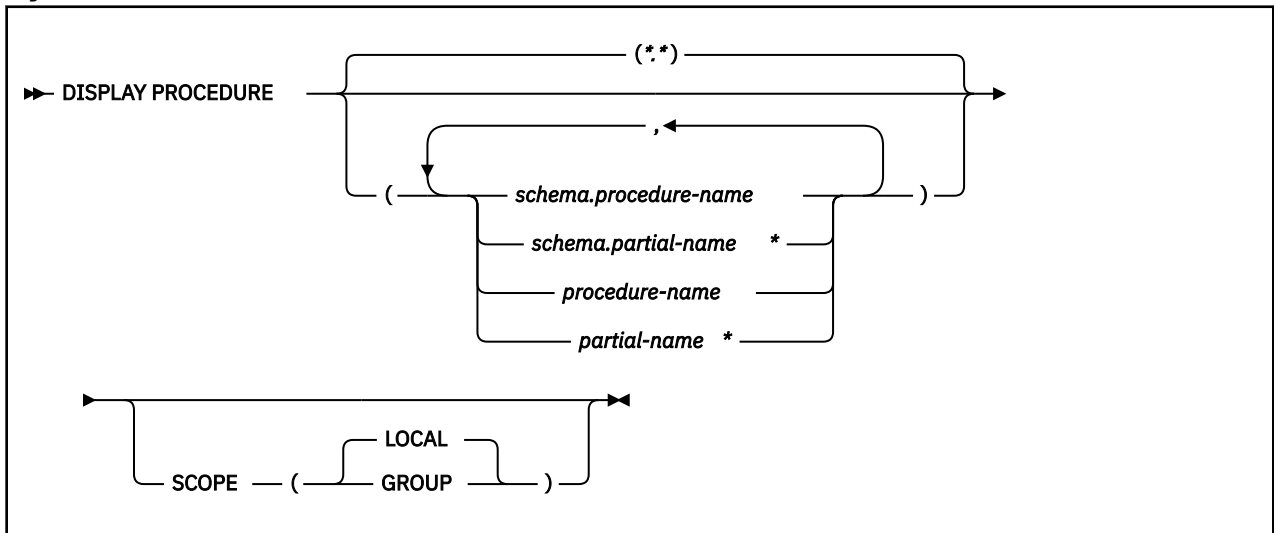

If you specify DISPLAY PROCEDURE **** or *schema.partial-name **, the privilege set of the process must include one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

If you are using an external security product to authorize usage of DISPLAY PROCEDURE, define SYSOPR as a user to the external security product for those cases in which DISPLAY PROCEDURE SCOPE(GROUP) runs on a remote system and SYSOPR is used as the authorization ID.

Syntax

Option descriptions

(***.***)

Displays information for all stored procedures in all schemas that Db2 applications have accessed since Db2 was started.

(**schema.procedure-name**)

Displays the specified stored procedure in the specified schema.

(**schema.partial-name ***)

Displays a set of stored procedures in the specified schema that Db2 applications have accessed since Db2 was started. The names of all procedures in the set begin with *partial-name* and can end with any string, including the empty string. For example, PAYROLL.ABC* displays information for all stored procedure names beginning with ABC in the PAYROLL schema.

(**procedure-name**)

Displays one or more specific stored procedure names in the SYSPROC schema. If no procedures are named, Db2 displays information for all stored procedures that have been accessed by Db2 applications.

(**partial-name ***)

Displays information for a set of stored procedures in the SYSPROC schema that Db2 applications have accessed since Db2 was started. The names of all procedures in the set begin with *partial-name* and can end with any string, including the empty string. For example, ABC* displays information for all stored procedures in the SYSPROC schema with names that begin with ABC.

SCOPE

Specifies the scope of the command.

(**LOCAL**)

Specify to display information about procedures on the local member only.

(**GROUP**)

Specify to display information about procedures on all members of the data sharing group.

Output

Message [DSNX940I](#) (Db2 Messages) indicates the beginning of the output of the command.

Displaying native SQL procedures: Native SQL procedures are not displayed in the DISPLAY PROCEDURE output unless you run the procedures in DEBUG mode. If you run a procedure in DEBUG mode, the WLM environment column in the output contains the WLM ENVIRONMENT FOR DEBUG that you specified when you created the native SQL procedure.

The DISPLAY PROCEDURE output shows the statistics of a native SQL procedure as 0 if the STOP PROCEDURE command is processing the native SQL procedure.

Examples

Example: Displaying information about all stored procedures that have been accessed

The following command displays information about all stored procedures that applications have accessed in a Db2 subsystem.

```
-DISPLAY PROCEDURE
```

The output is similar to the following output:

```
DSNX940I = DSNX9DIS DISPLAY PROCEDURE REPORT FOLLOWS-
----- SCHEMA=SYSPROC
PROCEDURE    STATUS    ACTIVE    QUED    MAXQ    TIMEOUT    FAIL    WLM_ENV
USERPRC1     STARTED    0         0        1         0         0    SANDBOX
USERPRC2     STOPQUE    0         5        5         3         0    SANDBOX
USERPRC3     STARTED    2         0        6         0         0    SANDBOX
USERPRC4     STOPREJ    0         0        1         0         0    SANDBOX
DSNX9DIS DISPLAY PROCEDURE REPORT COMPLETE
DSNX9022I = DSNX9COM '-DISPLAY PROC' NORMAL COMPLETION
```

Example: Displaying information about a specific stored procedure

The following command displays information about stored procedures USERPRC2 and USERPRC4 in the SYSPROC schema. The SYSPROC schema is the default schema if the schema name is not explicitly specified.

```
-DISPLAY PROCEDURE (USERPRC2,USERPRC4)
```

The output is similar to the following output:

```
DSNX940I = DSNX9DIS DISPLAY PROCEDURE REPORT FOLLOWS-
----- SCHEMA=SYSPROC
PROCEDURE    STATUS    ACTIVE    QUED    MAXQ    TIMEOUT    FAIL    WLM_ENV
USERPRC2     STOPQUE    0         5        5         3         0    SANDBOX
USERPRC4     STOPREJ    0         0        1         0         0    SANDBOX
DSNX9DIS DISPLAY PROCEDURE REPORT COMPLETE
DSNX9022I = DSNX9COM '-DISPLAY PROC' NORMAL COMPLETION
```

Example: Displaying information about all stored procedures in specified schemas

The following command displays information about all stored procedures in the PAYROLL schema and in the HRPROD schema:

```
-DISPLAY PROCEDURE (PAYROLL.*,HRPROD.*)
```

The output is similar to the following output.

```
DSNX940I = DSNX9DIS DISPLAY PROCEDURE REPORT FOLLOWS-
----- SCHEMA=PAYROLL
PROCEDURE    STATUS    ACTIVE    QUED    MAXQ    TIMEOUT    FAIL    WLM_ENV
PAYPRC1     STARTED    0         0        1         0         0    PAYROLL
PAYPRC2     STOPQUE    0         5        5         3         0    PAYROLL
PAYPRC3     STARTED    2         0        6         0         0    PAYROLL
USERPRC4     STOPREJ    0         0        1         0         0    SANDBOX

----- SCHEMA=HRPROD
PROCEDURE    STATUS    ACTIVE    QUED    MAXQ    TIMEOUT    FAIL    WLM_ENV
HRPRC1     STARTED    0         0        1         0         0    HRPROCS
HRPRC2     STOPREJ    0         0        1         0         0    HRPROCS
DSNX9DIS DISPLAY PROCEDURE REPORT COMPLETE
DSNX9022I = DSNX9COM '-DISPLAY PROC' NORMAL COMPLETION
```

Example: Displaying information about stopped procedures

Suppose that all stored procedures in schema SYSADM that begin with the characters "SP" have been stopped. The following command displays information about those stored procedures.

```
-DISPLAY PROCEDURE(SYSADM.SP*)
```

The output is similar to the following output.

```
DSNX940I = DSNX9DIS DISPLAY PROCEDURE REPORT FOLLOWS-
----- SCHEMA=SYSADM
PROCEDURE      STATUS      ACTIVE      QUED      MAXQ      TIMEOUT    FAIL      WLM_ENV
SPC1           STOPQUE      0           0           0           0           0      WLMENV1
SPC2           STOPQUE      0           0           0           0           0      WLMENV3
DSNX9DIS PROCEDURES SP - SP* STOP QUEUE
DSNX9DIS DISPLAY PROCEDURE REPORT COMPLETE
DSNX9022I = DSNX9COM '-DISPLAY PROC' NORMAL COMPLETION
```

Chapter 32. -DISPLAY PROFILE (Db2)

The DISPLAY PROFILE command allows you to determine if profiling is active or inactive

Abbreviation: -DIS PROFILE

Environment

This command can be issued from the z/OS console, through a batch job or the instrumentation facility interface (IFI). However, in general, this command is intended for use by tools.

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Syntax

►► DISPLAY PROFILE ◄◄

Examples

The following command displays the status of active and inactive profiling activities.

```
-DISPLAY PROFILE
```

Output

Message [DSNT753I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Chapter 33. -DISPLAY RLIMIT (Db2)

The Db2 command DISPLAY RLIMIT displays the current status of the resource limit facility (governor).

If the facility has already been started, DISPLAY RLIMIT also displays the ID of the resource limit specification table or the resource limit middleware table that is being used.

Abbreviation: -DIS RLIM

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Output

Message [DSNT700I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Syntax

```
➤ DISPLAY RLIMIT ➤
```

Examples

Example: Displaying the current status of the resource limit facility

The following command displays the current status of the resource limit facility.

```
-DISPLAY RLIMIT
```

When the resource limit facility is inactive, the output is similar to the following output.

```
DSNT701I - RESOURCE LIMIT FACILITY IS INACTIVE  
DSN9022I - DSNTCDIS 'DISPLAY RLIMIT' NORMAL COMPLETION
```

When the resource limit facility is active, the output is similar to the following output.

```
DSNT700I = SYSADM.DSNRLST03 IS THE ACTIVE RESOURCE LIMIT  
SPECIFICATION TABLE  
DSN9022I = DSNTCDIS 'DISPLAY RLIMIT' NORMAL COMPLETION
```

Related concepts

[The resource limit facility \(Introduction to Db2 for z/OS\)](#)

[Resource limit facility controls \(Db2 Performance\)](#)

Related tasks

[Setting limits for system resource usage by using the resource limit facility \(Db2 Performance\)](#)

Related reference

[-START RLIMIT \(Db2\)](#)

The Db2 command START RLIMIT starts the resource limit facility (governor) and specifies a resource limit specification table for the facility to use.

[-STOP RLIMIT \(Db2\)](#)

The Db2 command STOP RLIMIT stops the resource limit facility.

Related information

[DSNT700I \(Db2 Messages\)](#)

Chapter 34. -DISPLAY RESTSVC (Db2)

The Db2 command DISPLAY RESTSVC displays the status of REST services that exist in Db2.

This command displays one or more lines of output for each REST service that is defined in Db2. You can qualify REST service names with a collection-id.

The information returned by the DISPLAY RESTSVC command reflects a dynamic status. By the time the information is displayed, it is possible that the status could have changed.

Abbreviation: -DIS RESTSVC

Environment

This command can be issued from a z/OS® console, a DSN session under TSO, a DB2I panel (Db2 COMMANDS), an IMS™ or CICS® terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- DISPLAY system privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

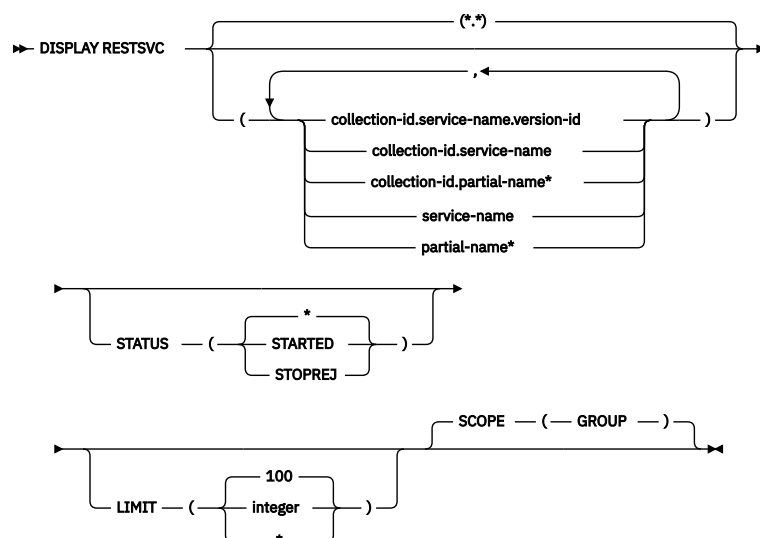

If you specify DISPLAY RESTSVC *.* , collection-id.partial-name* , or partial-name* , the privilege set of the process must include one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

If you are using an external security product to authorize usage of DISPLAY RESTSVC, define SYSOPR as a user to the external security product for those cases in which DISPLAY RESTSVC SCOPE(GROUP) runs on a remote system and SYSOPR is used as the authorization ID.

Syntax

Option descriptions

For mixed case names, use single quotes (') around the input.

(*.*)

Displays the status for all versions of all REST services in all collection-ids. Note: when specified, *. can be the only RESTSVC parameter.

(collection-id.service-name.version-id)

Displays a specific version of the specified REST service in the specified collection-id.

(collection-id.service-name)

Displays information for all versions of the REST service in the specified collection-id.

(collection-id.partial-name*)

Displays information for all versions of a set of REST services in the specified collection-id. The names of all REST services in the set begin with partial-name and can end with any string, including the empty string. For example, PAYROLL.ABC* starts all REST services with names that begin with ABC in the PAYROLL collection-id.

(service-name)

Displays all versions of the specified REST service in the SYSIBMSERVICE collection-id.

(partial-name*)

Displays all versions in a set of REST services in the SYSIBMSERVICE collection-id. The names of all REST services in the set begin with partial-name and can end with any string, including the empty string. For example, ABC* starts all REST services names that begin with ABC in the SYSIBMSERVICE collection-id.

STATUS

Specifies the status of the services to be displayed.

(*)

Services of any status are displayed.

(STARTED)

Services of the STARTED status are displayed.

(STOPREJ)

Services of the STOPREJ (service is stopped from being invoked with a reject of the request back to the client) are displayed.

LIMIT

Limits the number of services to be displayed by the command.

(integer)

The maximum number of services that are displayed. The default is 100. The maximum number of messages that can be displayed is limited by the space available on the console.

(*)

Limits the display to the space available.

SCOPE

Specifies the scope of the command.

(GROUP)

Specify to display information about REST services on all members of the data sharing group.

Output

Message [DSNL601I \(Db2 Messages\)](#) indicates the beginning of the output of a DISPLAY RESTSVC command. Message [DSN9022I \(Db2 Messages\)](#) will indicate the end of the output of the command if no failure occurred during the processing of the command. Message [DSN9023I \(Db2 Messages\)](#) will indicate the end of the output of the command if an abend had occurred during the processing of the command.

Examples

Example: No authority for a DISPLAY RESTSVC command

The following command attempts to use the DISPLAY RESTSVC command on a service that the user does not have the proper authorities for:

```
-DB2A DIS RESTSVC
```

The output is similar to this output:

```
DSN9016I  -DB2A '-DIS RESTSVC' COMMAND REJECTED, UNAUTHORIZED REQUEST
DSN9023I  -DB2A DSN9SCND '-DIS RESTSVC' ABNORMAL COMPLETION
```

Example: Display a service when specifying the version id

The following command displays version V3 of the SVCWVRSN0300 service in the VRSNTEST002 collection:

```
-DIS RESTSVC(VRSNTEST002.SVCWVRSN0300.V3)
```

The output is similar to this output:

```
DSNL601I  -DB2A DISPLAY RESTSVC REPORT FOLLOWS-
DSNL610I  -DB2A
---- COLLECTION=VRSNTEST002
SERVICE                                     VERSION      STATUS
SVCWVRSN0300                                V3           STARTED*
DSN9022I  -DB2A DSNLJDSS 'DISPLAY RESTSVC' NORMAL COMPLETION
```

Example: Display a service using the wildcard character

The following command displays the services in the collection called MYTEST001 until the given limit, 10:

```
-DB2A DIS RESTSVC(MYTEST001.*)LIMIT(10)
```

The output is similar to this output:

```
DSNL601I  -DB2A DISPLAY RESTSVC REPORT FOLLOWS-
DSNL610I  -DB2A
---- COLLECTION=MYTEST001
SERVICE                                     VERSION      STATUS
SERVICE0001                                STOPREJ*
SERVICE0002                                STOPREJ*
SERVICE0003                                STOPREJ*
```

```
SERVICE0004 STOPREJ*
SERVICE0005 STOPREJ*
SERVICE0006 STOPREJ*
SERVICE0007 STOPREJ*
SERVICE0008 STOPREJ*
SERVICE0009 STOPREJ*
SERVICE0010 STOPREJ*
DSNL605I DISPLAY RESTSVC TERMINATED WITH MAXIMUM LINES
DSN9022I -DB2A DSNLJDSS 'DISPLAY RESTSVC' NORMAL COMPLETION
```

Example: No services found when trying to display a service

The following command attempts to display any service in collection a. No service that can be found in that collection.

```
-DB2A DIS RESTSVC(A.*)
```

The output is similar to this output:

```
DSNL601I -DB2A DISPLAY RESTSVC REPORT FOLLOWS-
DSNL603I -DB2A NO SERVICES FOUND FOR A.*
DSN9022I -DB2A DSNLJDSS 'DISPLAY RESTSVC' NORMAL COMPLETION
```

Example: Displaying services with a mixed case collection name.

The following command displays the services within the collection ID BankDemo.

```
-DB2A DIS RESTSVC('BankDemo.*')
```

The output is similar to this output:

```
DSNL601I -DB2A DISPLAY RESTSVC REPORT FOLLOWS-
DSNL610I -DB2A
---- COLLECTION=BankDemo
SERVICE                                VERSION          STATUS
CreateAccount                          STARTED*
DepositById                            STARTED*
DisplayAccountById                     STARTED*
DisplayAcctTranHistory                 STARTED*
DisplayAllAccounts                    STARTED*
TransferBetweenAccounts                STARTED*
DSN9022I -DB2A DSNLJDSS 'DISPLAY RESTSVC' NORMAL COMPLETION
```

Related reference

BIND SERVICE (DSN)

The BIND SERVICE (DSN) subcommand builds an application package that represents a Db2 REST service. Db2 records the description of the service in the catalog tables and saves the prepared package in the directory.

BIND and REBIND options for packages, plans, and services

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

FREE SERVICE (DSN)

The FREE SERVICE (DSN) subcommand deletes an application package that represents a Db2 REST service. The command also removes the corresponding entry from the catalog tables.

-START RESTSVC (Db2)

The Db2 command START RESTSVC starts the definition of a REST service that is stopped. You can qualify REST service names with a collection ID name.

-STOP RESTSVC (Db2)

The Db2 command STOP RESTSVC prevents Db2 from accepting any new discover details or invoke requests for one or more REST services. You can qualify REST service names with a collection ID name.

Chapter 35. -DISPLAY STATS (Db2)

The Db2 command DISPLAY STATS displays statistics about the use of resources by Db2 for certain processes.

Abbreviation: -DIS STATS

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group

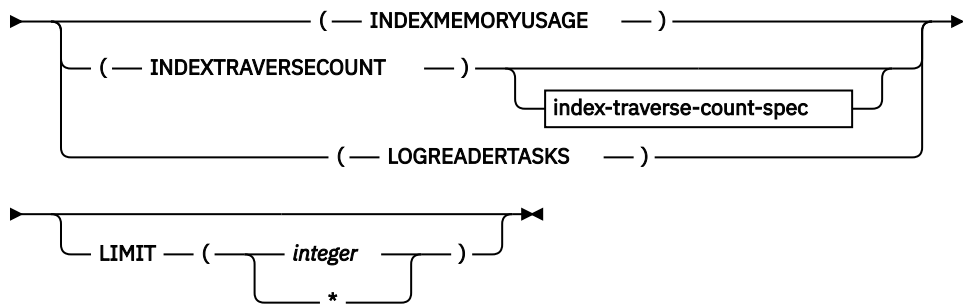

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

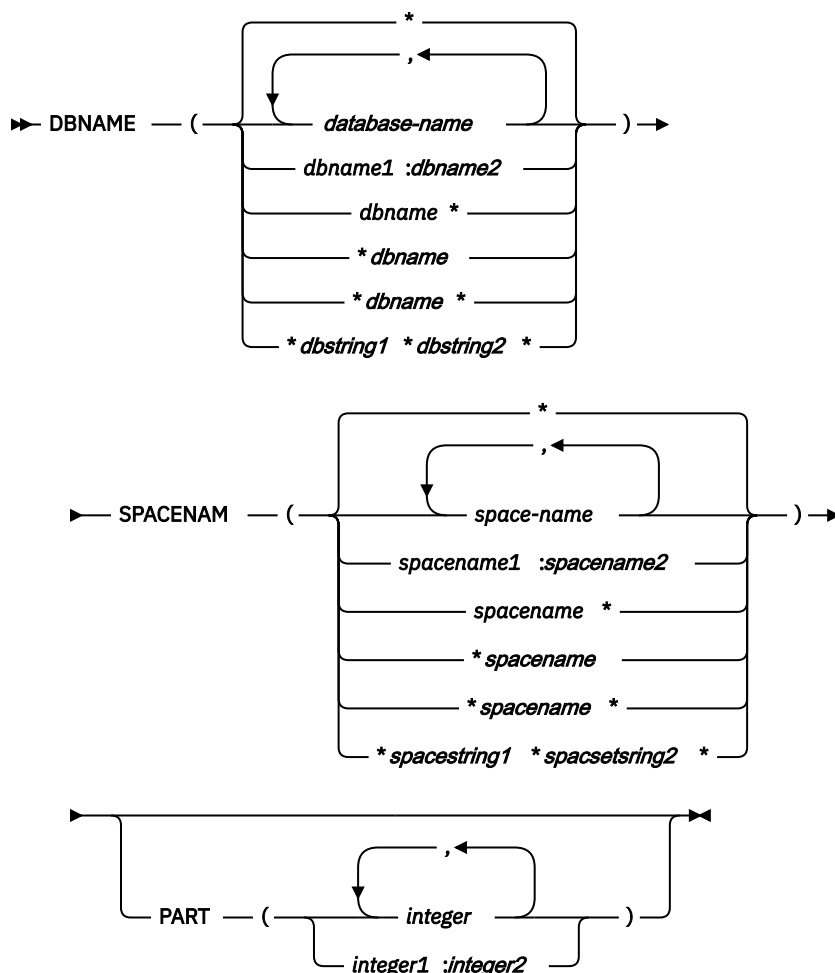

- DISPLAY system privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Syntax

➤ DISPLAY — STATS ➤

index-traverse-count-spec

Option descriptions

INDEXMEMORYUSAGE

Specifies that statistics about the current amount of memory that Db2 uses for fast traversal of indexes are displayed.

Abbreviations: IDXMEMUSE or IMU

INDEXTRAVERSECOUNT

Specifies the display of index traverse counts for a specific index, or for a specified number of indexes with the highest traverse counts in descending order. The following variations are accepted:

Abbreviations: IDXTRAVCNT or ITC

DBNAME

Specifies one or more databases for which index traverse counts are displayed.

Abbreviation: DBN

The following variations are accepted:

(database-name, ...)

Identifies one or more database names, separated by commas or blanks.

(*)

All databases that are defined to the Db2 subsystem for which the privilege set of the process has the required authorization.

(dbname1:dbname2)

All databases whose names, in UNICODE, are between *dbname1* and *dbname2* inclusive.

(dbname*)

All databases whose names begin with the string *dbname* that contains 1 - 7 characters.

(*dbname)

All databases whose names end with the string *dbname* that contains 1 - 7 characters.

(*dbname*)

All databases whose names contain the string *dbname*, where *dbname* that contains 1 - 6 characters.

(*dbstring1*dbstring2*)

All databases whose names contain the strings *dbstring1* and *dbstring2* that together contain a total of 2 - 5 characters.

SPACENAM

Specifies one or more indexes for which the index traverse counts are displayed.

Abbreviations: SPACE or SP

The following variations are accepted:

(spacename, ...)

One or more named index space names, with comma or blank separators.

(*)

All index spaces that are defined to the Db2 subsystem for which the privilege set of the process has the required authorization.

(spacename1:spacename2)

All index spaces whose names, in UNICODE, are between *spacename1* and *spacename2* inclusive.

(spacename*)

All index spaces whose names begin with the string *spacename* that contains 1 - 7 characters.

(*spacename)

All index spaces whose names end with the string *spacename* that contains 1 - 7 characters.

(*spacename*)

All index spaces whose names contain the string *spacename* that contains 1 - 6 characters.

(*spacestring1*spacestring2*)

All index spaces whose names contain the strings *spacestring1* and *spacestring2* that together contain 2 - 5 characters.

PART

Indicates the partition number of one or more partitions to display.

The *integer* specified must identify a valid partition number for the corresponding space name and database name. *integer* can be written to designate one of the following values:

- A list of one or more partitions
- A range of all partition numbers that collate greater than or equal to *integer 1* and less than or equal to *integer2*
- A combination of lists and ranges

LOGREADERTASKS

Specifies that statistics about the log reading task (SRB) are displayed.

Abbreviations: LOGREADER or LRT

LIMIT

Limits the number of messages that are to be displayed.

integer

The maximum number of messages that are to be displayed. This value must be between 1 and 9999. The maximum number of messages that can be displayed is limited by the space that is available.

(*)

Limits the display to the number of messages that fit in the available space.

Output

- Message [DSNT783I](#) indicates the beginning of the output of the command when INDEXMEMORYUSAGE or an equivalent abbreviation is specified.
- Message [DSNT788I](#) indicates the beginning of the output of the command when LOGREADERTASKS or an equivalent abbreviation is specified.
- Message [DSNT830I](#) (Db2 Messages) indicates the beginning of the output of the command when INDEXTRAVERSECOUNT or an equivalent abbreviation is specified.

Example: Displaying information about the use of fast index traversal

You can use the DISPLAY STATS command to display information about all indexes for which fast index traversal (sometimes called "fast traverse blocks" or "FTB") is being used. Suppose that you issue the following command:

```
-DISPLAY STATS(INDEXMEMORYUSAGE)
```

In the Db2 subsystem on which you issue the command, the only index for which fast index traversal is being used has five levels of index pages, one partition, and uses 18339 KB of memory for fast index traversal.

The output is similar to the following output:

```
DSNT783I -  
DBID  PSID  DBNAME  IX-SPACE LVL PART SIZE(KB)  
-----  
00278 00005 DB1      IX1      005 0001 00018339  
***** DISPLAY OF STATS ENDED *****  
DSN9022I - DSNTDSTS 'DISPLAY STATS' NORMAL COMPLETION
```

Now suppose that you run the -DISPLAY STATS(INDEXMEMORYUSAGE) command on a Db2 subsystem on which fast index traversal is being used on five partitions of an index, and the number of levels of index pages and the amount of memory that is being used for fast index traversal is the same for all partitions.

The output is similar to the following output:

```
DSNT783I -  
DBID PSID DBNAME  IX-SPACE LVL PART SIZE(KB)  
-----  
0017 0005 DB1      IX1      003 0006 00000061  
-THRU                                0010  
***** DISPLAY OF STATS ENDED *****  
DSN9022I - DSNTDSTS 'DISPLAY STATS' NORMAL COMPLETION
```

Examples: Displaying information about the number of index traversals

Example: display index traversal counts for a specific index partition

```
-DISPLAY STATS(INDEXTRAVERSECOUNT) DBNAME(DB1) SPACENAM(IX1) PART(1)
```

The example command returns output similar to:

```
DSNT830I -  
DBID PSID DBNAME  IX-SPACE LVL PART TRAV. COUNT  
-----  
0017 0005 DB1      IX1      003 0001 00000000999  
***** DISPLAY OF STATS ENDED *****
```

Example: Display the index spaces with the most index traversals

You can display a specific number of index spaces in a database with the most index traversals.

```
-DISPLAY STATS(ITC) DBNAME(DB1) LIMIT(*)
```

The example command returns output similar the to the following output, with the traverse counts in descending order:

```
DSNT830I -
DBID PSID DBNAME IX-SPACE LVL PART TRAV. COUNT
-----
0017 0005 DB1 IX1 003 0001 00000050099
0017 0005 DB1 IX2 003 0010 00000050001
0017 0005 DB1 IX2 003 0008 00000030021
0017 0005 DB1 IX2 003 0016 00000029999
0017 0005 DB1 IX3 003 0001 00000000999
0017 0005 DB1 IX1 003 0003 00000000800
0017 0005 DB1 IX5 003 0001 00000000666
0017 0005 DB1 IX1 003 0022 00000000100
0017 0005 DB1 IX7 003 0001 00000000100
0017 0005 DB1 IX1 003 0002 00000000100
***** DISPLAY OF STATS ENDED *****
```

Example: Displaying information about log reading tasks

You can use the DISPLAY STATS command to display information about the status of log reading tasks. The output of the DISPLAY STATS(LOGREADERTASKS) command is similar to the following output:

```
12.31.38 STC00116 DSNT788I -SSID
SESSIONID STATUS CURR. POSITION NUM RECS AGE
-----
553E982796560801 READING 0000000000018898F400 32071 89s
553EDAC3E7842E02 SUSP EOS 00000000000188CA2280 30 6s
***** DISPLAY OF STATS TERMINATED *****
12.31.38 STC00116 DSN9022I -DB2A DSNTDSTS 'DISPLAY STATS' NORMAL COMPLETION
```

See message [DSNT788I](#) for a description of the information that is returned.

Related information

[DSNT783I \(Db2 Messages\)](#)

[DSNT788I \(Db2 Messages\)](#)

Chapter 36. -DISPLAY THREAD (Db2)

The Db2 command DISPLAY THREAD displays current status information about Db2 threads.

A Db2 thread can be an allied thread, a database access thread, or a parallel task thread. Threads can be active, inactive, indoubt, or postponed.

Distributed threads are those threads that have a connection with a remote location (active or inactive) or that had a connection with a remote location (indoubt). An allied thread and a parallel task thread can be distributed or non-distributed; a database access thread is always distributed.

The DISPLAY THREAD command allows you to select the type of information you want to display by using one or more of the following criteria:

- Active threads, inactive threads, indoubt threads, postponed threads, procedure threads, system threads, or the set of active, indoubt, postponed, and system threads (see the descriptions under the TYPE option for more information)
- Allied threads, including those threads that are associated with the address spaces whose connection names are specified
- Distributed threads, including those threads that are associated with a specific remote location
- Detailed information about connections with remote locations
- A specific logical unit of work ID (LUWID)

The information that is returned by the DISPLAY THREAD command reflects a dynamic status. When the information is displayed, it is possible that the status has changed. Moreover, the information is consistent only within one address space and is *not necessarily* consistent across all address spaces displayed.

Abbreviation: -DIS THD

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the SCOPE option.

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- DISPLAY system privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

Only under certain conditions, as described in the following lists, are any of the following options required.

If you do not specify either (*connection-name*) or (*), the following rules apply:

- If the command is issued from a DSN session under TSO, a DB2I panel (DB2 COMMANDS), or an IMS or CICS terminal, the connection name is inherited from the associated address space.
- If the command is not issued from one of those environments, the following rules apply:
 - If you do not specify either LOCATION or LUWID, processing terminates with a DSNV413I message.
 - If you do specify LOCATION or LUWID, only distributed threads of the type selected by the TYPE option are displayed.
 - When you explicitly specify *location-name* , only distributed threads of the type selected by the TYPE option that either have (active or inactive threads) or had (indoubt threads) a connection with the specified location are displayed.

(*connection-name* , ...)

Lists one or more connection names (of 1 to 8 characters each). Allied threads are selected only from the address spaces associated with those connection names. The LOCATION option can restrict what is displayed:

- If you specify LOCATION(*), only distributed threads of the type specified in the TYPE option are displayed.
- When you explicitly specify *location-name* , only distributed threads of the specified type that either have or had a connection with the specified location are displayed.

(*partial-connection , ...)**

Selects the connections that begin with the string *partial-connection* and can end with any string, including the empty string. For example, DISPLAY THREAD(CICS*,IMS*) selects all connection names that begin with the string 'CICS' or 'IMS'. The LOCATION option can restrict the display exactly the same way as previously described for *location-name* .

(*)

Displays all threads in all address spaces attached to Db2 and all database access threads of the types specified in the TYPE option. The LOCATION option can restrict what is displayed:

- If you specify LOCATION(*), only distributed threads are displayed.
- When you explicitly specify *location-name* , only distributed threads that either have (active or inactive threads) or had (indoubt threads) a connection with the specified location are displayed.

The **default** is to display only the connections that are associated with the transaction manager from which the command was entered.

SCOPE

Specifies the scope of the command.

(LOCAL)

Displays threads on only the current member.

(GROUP)

Displays all threads on the data sharing group.

TYPE

Tells the type of thread to display.

Abbreviation: T

(ACTIVE)

Displays only active threads. An active allied thread is connected to Db2 via TSO, BATCH, IMS, CICS or CAF. An active database access thread is connected by a network connection to another system and is performing work on behalf of that system. If, during command processing, an active thread becomes indoubt, it can appear twice—once as active and once as indoubt.

Abbreviation: A

The information that is produced by ACTIVE can be useful for debugging purposes, especially message DSNV402I.

(INDOUBT)

Displays only indoubt threads.

An indoubt thread is a participant in a two-phase commit protocol that has completed the first phase of commit, and has then lost communication with the commit coordinator and does not know whether to commit or roll back the updates that have been made.

The indoubt thread information that is displayed includes threads for which Db2 has a coordinator role, a participant role, or both coordinator and participant roles.

The commit coordinator for an allied thread is either a transaction manager (for example, IMS or CICS) or z/OS RRS for threads that use RRSAF. The commit coordinator for a database access thread is a requester at a remote system.

Indoubt threads hold locks on all resources that were updated.

Abbreviation: I

(*)

Displays active, indoubt, postponed, and system threads.

(INACTIVE)

Displays only inactive database access threads and connections that are connected by a network connection to another system. An inactive thread is idle and waits for a new unit of work to begin from that system.

Abbreviation: INA

Use qualifiers such as complete location names or LUWIDs with this option. When there are large numbers of inactive database access threads, unqualified display requests can temporarily change the Db2 working set, which can temporarily affect the performance of active threads.

(POSTPONED)

Displays information about units of work whose back-out processing has been postponed.

Abbreviation: P

After you have identified postponed threads, use the RECOVER POSTPONED command, described, to complete backout processing for the postponed units of work.

(PROC)

Displays information about threads that are executing stored procedures and user-defined functions. All -DISPLAY THREAD keywords are valid when TYPE(PROC) is specified.

(SYSTEM)

Displays a subset of system agent threads with message DSNV402I. The system agent threads displayed are deemed useful for serviceability purposes. Not all system threads are displayed.

Abbreviation SYS

If the command or system agent can be canceled, then the associated token is displayed in the output. You can specify this option from early in the restart to late in the shutdown process. If you issue this command before or after release work, then the restart or shutdown status is displayed in the output.

When the token is identified for the database command or systems agent, you can use the CANCEL THREAD(token) command to cancel it.

LOCATION(*location-name* , ...)

Limits the display to distributed threads as described.

Abbreviation: LOC

location-name

Displays only distributed threads of the specified type that either have (active or inactive threads) or had (indoubt threads) a remote connection with the specified *location-name* .

Db2 does not receive a location name from requesters that are not Db2 for z/OS subsystems. To display information about a requester that is not a Db2 for z/OS subsystem, enter its LU name or IP address. Enclose the LU name in the less-than (<) and greater-than (>) symbols. For example, the following command displays information about a remote location (that is not Db2 for z/OS) with the LU name of LULA:

```
-DISPLAY THREAD (*) LOCATION (<LULA>)
```

The following command displays information about a remote location (that is not Db2 for z/OS) with an IP address of ::FFFF:123.34.101.98:

```
-DISPLAY THREAD (*) LOCATION (::FFFF:123.34.101.98)
```

Db2 uses the <LU name> notation or IP address in messages displaying information about requesters other than Db2.

partial-location *

Selects all location names that begin with the string *partial-location* and can end with any string, including the empty string. For example, LOCATION(SAN*) selects all location names that begin with the string 'SAN'.

You can use an asterisk (*) when specifying an LU name in the same manner as previously described for other location names that are not Db2 for z/OS subsystems. For example, LOCATION(<LULA*) selects all remote locations (that are not Db2 for z/OS) with an LU name that begins with the string 'LULA'.

You cannot use an asterisk when you specify an IP address.

(*)

Display all distributed threads of the specified type.

LUWID(*luwid* , ...)

Displays information about the distributed threads that have the specified LUWID. It is possible for more than one thread to have the same LUWID.

luwid

Consists of a fully qualified LU network name followed by a period and an LUW instance number.

The LU network name consists of a one- to eight-character network ID, a period, and a one- to eight-character network LU name. The LUW instance number consists of 12 hexadecimal characters that uniquely identify the unit of work.

partial-luwid *

Selects all LUWIDs that begin with the string *partial-luwid* and can end with any string, including the empty string. For example, LUWID(NET1.*) selects all LUWIDs with a network name of 'NET1'.

token

Identifies a specific thread in an alternate way. Db2 assigns a token to each distributed thread it creates. A token is a one- to six-digit decimal number that appears after the equal sign in all Db2 messages that display a LUWID.

If you do not include any periods nor a '*' in the LUWID specification, Db2 assumes that you are supplying a token. The token that Db2 assigns to a specific LUWID is unique for that Db2 subsystem, but not necessarily unique across subsystems.

ACCEL(*accelerator-name* , ...)

Limits the list to threads with active accelerator processes executing within the specified accelerator server.

accelerator-name

The specific accelerator server name. If ACCEL(accelerator-name) is specified, only threads active in that specific ACCEL will be displayed.

Supplying an asterisk (*) as the accelerator-name indicates that the display must include all threads with any accelerator server. If ACCEL(*) is specified, only threads currently active in an accelerator will be displayed.

DETAIL

Displays additional information about active, inactive, and indoubt threads.

LIMIT

Accepts numeric input that specifies the number of lines of output that you want. The default limit is 512, so you must use the limit keyword if you want to set a different limit.

If you select LIMIT(*), all output that can be properly formatted within internal storage constraints will be displayed.

When SCOPE(GROUP) is specified, the line limit is enforced per member displayed.

RRSURID(*rrs-urid*)

Specifies that only threads that match the specified RRSURID selection criteria are to be displayed.

- If RRSURID(*rrs-urid*) is specified, any thread involved in the RRSURID that has the value *rrs-urid* , and that meets any other specified selection criteria, will be displayed.
- If RRSURID(*) is specified, any thread involved in any RRSURID, and that meets any other specified selection criteria, will be displayed.

Usage notes

Formatted report for distributed threads

The series of messages, DSNV444I through DSNV446I, augment the formatted report for DISPLAY THREAD TYPE (ACTIVE or INACTIVE) for distributed threads.

Threads for connections to remote servers

A database access thread that is connected to a requester can also be connected to another database server location using DRDA access. In that case, Db2 issues message DSNV445I for the requester, and message DSNV444I and zero or more DSNV446I messages for the remote server connections. In addition, the database access thread acts as an intermediate database server.

Participant threads waiting for the commit or abort decision

A DSNV465I message is issued for an active participant thread that has completed phase 1 of commit processing and has been waiting for the commit or abort decision from the coordinator for more than 60 seconds.

DISPLAY THREAD output limit

If a DISPLAY THREAD command is issued from the z/OS console, the maximum number of lines of output for a single invocation of the command is 512 lines (at which time a DSNV513I, DSNV514I, or DSNV515I message is printed). If you do not receive the required information in the first 255 lines of output, issue the command again, specifying the TYPE option and a specific connection name, location, LUWID, or a combination of these, as appropriate, to reduce the output.

Showing parallel tasks

The DISPLAY THREAD command shows parallel tasks by using a status type of PT. The parallel tasks are displayed immediately after the originating task. If the thread has a status of PT, the connection name contains blanks if the thread of the originating task is running on the same Db2 subsystem. This shows that these parallel tasks are related to the originating task.

Displaying the XID

If the DISPLAY THREAD command is issued with the TYPE ACTIVE and DETAIL options, or with the TYPE INDOUBT option, message DSNV440I displays the contents of the XID. The contents of the XID are displayed as a hexadecimal value.

The XID is displayed in the DISPLAY THREAD TYPE INDOUBT report if the indoubt transaction is XID related.

Threads associated with trusted context

If a thread is associated with a trusted context, message DSNV485I displays the trusted context name, system authorization ID, and role.

Displaying threads while Db2 is active

All -DISPLAY and -CANCEL commands are allowed to run concurrent to other command issued through the console. This ensures thread tokens can be identified and used for soft thread cancels, even while long running console commands are in progress. The majority of system threads displayed cannot be canceled. For example, a 0 thread token is provided for DSNV402I messages.

The command preprocessor (GCPC) console commands tasks can be canceled, and a token will be provided for these threads in a DSNV402I message in the -DISPLAY THREAD(*) TYPE(SYSTEM) report.

Displaying threads during shutdown

All commands will be quiesced at the beginning of shutdown. Only -DISPLAY THREAD(*) commands will be accepted after this point, and these will be valid until the last stages of shutdown. Much like -DISPLAY THD(*) during restart, only -DISPLAY THREAD(*) TYPE(SYSTEM) will produce meaningful thread information. All other variations of -DISPLAY THREAD(*) will terminate without thread data. If SCOPE(GROUP) is specified during shutdown, then a DSNV495I message will be displayed and the command will only execute locally.

Output

Message [DSNV401I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Examples

Example: Displaying information about a local thread

The output of the command DISPLAY THREAD shows a token for every thread, distributed or not. This example shows the token for an allied thread that is not distributed. The token is 123. You can use the thread's token as the parameter in the CANCEL THREAD command.

```
-DISPLAY THREAD(*)
```

This command produces output similar to the following output:

```
DSNV401I - DISPLAY THREAD REPORT FOLLOWS -
DSNV402I - ACTIVE THREADS -
NAME      ST A  REQ ID          AUTHID  PLAN      ASID  TOKEN
BATCH     T  *    5 BKH2C        SYSADM   BKH2     000D   123
DISPLAY ACTIVE REPORT COMPLETE
DSN9022I - DSNVDT '-DIS THD' NORMAL COMPLETION
```

Example: Displaying information about threads at all locations

This example shows information about conversation activity when distribution information is displayed for active threads. Db2 returns the following output, indicating that the local site application is waiting for a conversation to be allocated in Db2, and that a Db2 server is accessed by a DRDA client using TCP/IP.

```
-DISPLAY THREAD(*) LOCATION(*) DETAIL
```

This command produces output similar to the following output:

```
DSNV401I - DISPLAY THREAD REPORT FOLLOWS -
DSNV402I - ACTIVE THREADS -

Example: Displaying information about indoubt threads

In this example, a system at Site 1 has a TSO application and an IMS application. The system at Site 1 fails after Db2 commits the TSO application, but before the commit decision has been communicated to the participant subsystems at Site 2. The failure occurs before IMS has communicated the commit or rollback decision to the Site 1 Db2 subsystem. The DISPLAY THREAD commands that are issued at Site 1 and 2 show report output similar to the following:

The following DISPLAY THREAD command is issued at Site 1:

```
-DISPLAY THREAD(*) TYPE(INDOUBT)
```

This command produces output similar to the following output:

```
DSNV401I - DISPLAY THREAD REPORT FOLLOWS -
DSNV406I - INDOUBT THREADS -

DISPLAY INDOUBT REPORT COMPLETE
DSN9022I - DSNVDT '-DIS THREAD' NORMAL COMPLETION
```

Example: Displaying information about a stored procedure thread that is waiting

This example shows a thread executing within a stored procedure and a thread waiting for a stored procedure to be scheduled. Assume that an application makes a call to stored procedure PROC1 and then to stored procedure PROC2. PROC2 is in a STOP QUEUE state.

The output for PROC1 while it is executing shows a status of SP in the ST column, which indicates that a thread is executing within a stored procedure:

```
-DISPLAY THREAD(*)
```

This command produces output similar to the following output:

```
DSNV401I - DISPLAY THREAD REPORT FOLLOWS -
DSNV402I - ACTIVE THREADS - 176
NAME      ST A  REQ ID      AUTHID  PLAN      ASID TOKEN
BATCH     SP   3  RUNAPPL  SYSADM  PL01AP01 001D   43
V429 CALLING STORED PROCEDURE PROC1, LOAD MODULE LMPROC1
```

```

DISPLAY ACTIVE REPORT COMPLETE
DSN9022I - DSNVDT '-DISPLAY THREAD' NORMAL COMPLETION

```

The output for PROC2, while it is queued, shows a status of SW in the ST column, which indicates that a thread is waiting for a stored procedure to be scheduled:

```
-DISPLAY THREAD(*)
```

This command produces output similar to the following output:

```

DSNV401I - DISPLAY THREAD REPORT FOLLOWS -
DSNV402I - ACTIVE THREADS - 198
NAME      ST  A  REQ ID      AUTHID  PLAN      ASID  TOKEN
BATCH     SW  *   13 RUNAPPL      SYSADM  PL01AP01  001D   43
V429 CALLING STORED PROCEDURE PROC2, LOAD MODULE
DISPLAY ACTIVE REPORT COMPLETE
DSN9022I - DSNVDT '-DISPLAY THREAD' NORMAL COMPLETION

```

Example: Displaying information about autonomous procedures

The following example shows a thread that invokes an autonomous procedure. The autonomous procedure and its token are identified by a DSNV520I message. You can cancel the autonomous procedure by canceling the invoking thread. In this example that thread with token 13 invoked the autonomous procedure.

```

- 08.23.58 STC00149 DSN9022I ( DSNVDT '-DIS THD' NORMAL COMPLETION
```

Example: Displaying information about threads when Db2 is the coordinator for an indoubt RRS unit of recovery

This example shows information about a thread where Db2 is the coordinator for an indoubt RRS unit of recovery. Db2 has committed the thread but has not been able to resolve the RRS UR with RRS.

```
-DISPLAY THREAD(*) TYPE(I) RRSURID(*)
```

This command produces output similar to the following output:

```
- 09.27.21 STC00185 DSNV406I ( INDOUBT THREADS -  
- COORDINATOR STATUS RESET URID AUTHID  
- UNKNOWN COMMITTED 123456789ABC UNKNOWN  
- V480-DB2 IS COORDINATOR FOR RRS URID C4D4FA267EB040000000001201020000  
00- DISPLAY INDOUBT REPORT COMPLETE  
- 09.27.21 STC00185 DSNV434I ( DSNVDT NO POSTPONED ABORT THREADS FOUND  
- 09.27.21 STC00185 DSN9022I ( DSNVDT '-DIS THD' NORMAL COMPLETION
```

Example: Displaying detailed information about threads in a distributed transaction

This example shows the XID for an active thread that is associated with an XA transaction manager:

```
-DISPLAY THREAD(*) DETAIL
```

This command produces output similar the following output:

```
#dis thd(*) det

DISPLAY ACTIVE REPORT COMPLETE
DSN9022I - DSNVDT '-DISPLAY THREAD' NORMAL COMPLETION
```

Example: Displaying information about threads for secondary connections

Suppose that a distributed application is using package-based continuous block fetch to access data on a server. The requester has opened a secondary connection for each cursor in the application.

You issue the following command at the requester:

```
-DB2B DIS THD(*) DETAIL
```

The command produces the following output:

```
DSNV401I  -DB2B DISPLAY THREAD REPORT FOLLOWS -
DSNV402I  -DB2B ACTIVE THREADS -
NAME      ST A   REQ ID      AUTHID   PLAN      ASID TOKEN
DB2CALL   TR *    3 RTESTSI    SYSADM    TESTS     002C     2
V437-WORKSTATION=DB2CALL, USERID=SYSADM,
      APPLICATION NAME=RTESTSI
V436-PGM=TESTS.TESTS, SEC=2, STMT=170, THREAD-INFO=SYSADM:DB2CALL:
      SYSADM:RTESTSI:*:*:*:*
V482-WLM-INFO=*:364029760*:2127818752
V444-USIBMSY.SYEC4B.CA57F2850247=2 ACCESSING DATA AT
      ( 1)STLEC4-::FFFF:127.0.0.1..446
V447--INDEX SESSID          A ST TIME
V448--( 1) 1038:446          N R5 1229312543740
DISPLAY ACTIVE REPORT COMPLETE
DSN9022I  -DB2B DSNVDT '-DIS THD' NORMAL COMPLETION
```

In the V448 information, a status of R5 means that the requester is receiving a response from the server, and that the thread with LUWID USIBMSY.SYEC4B.CA57F2850247 is processing a secondary connection in support of application RTESTSI, which is using package-based continuous block fetch.

You issue the following command at the server:

```
-DB2A DIS THD(*) DETAIL
```

The command produces the following output:

```
DSNV401I  -DB2A DISPLAY THREAD REPORT FOLLOWS -
DSNV402I  -DB2A ACTIVE THREADS -
NAME      ST A   REQ ID      AUTHID   PLAN      ASID TOKEN

DISPLAY ACTIVE REPORT COMPLETE
DSN9022I  -DB2A DSNVDT '-DIS THD' NORMAL COMPLETION
```

In the V448 information, a status of S5 means that the server is sending or preparing a response to the requester, and that the thread with LUWID USIBMSY.SYEC4DB2.CA57F2861190 is processing a secondary connection in support of application RTESTSI, which is using package-based continuous block fetch.

[DSNV401I \(Db2 Messages\)](#)

Chapter 37. -DISPLAY TRACE (Db2)

The Db2 command DISPLAY TRACE displays a list of active traces.

An additional option to this command and additional values for a few options of this command are not described here. They are intended for service and use under the direction of IBM support personnel.

Abbreviation: -DIS TRACE

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the value of the SCOPE option.

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- DISPLAY privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

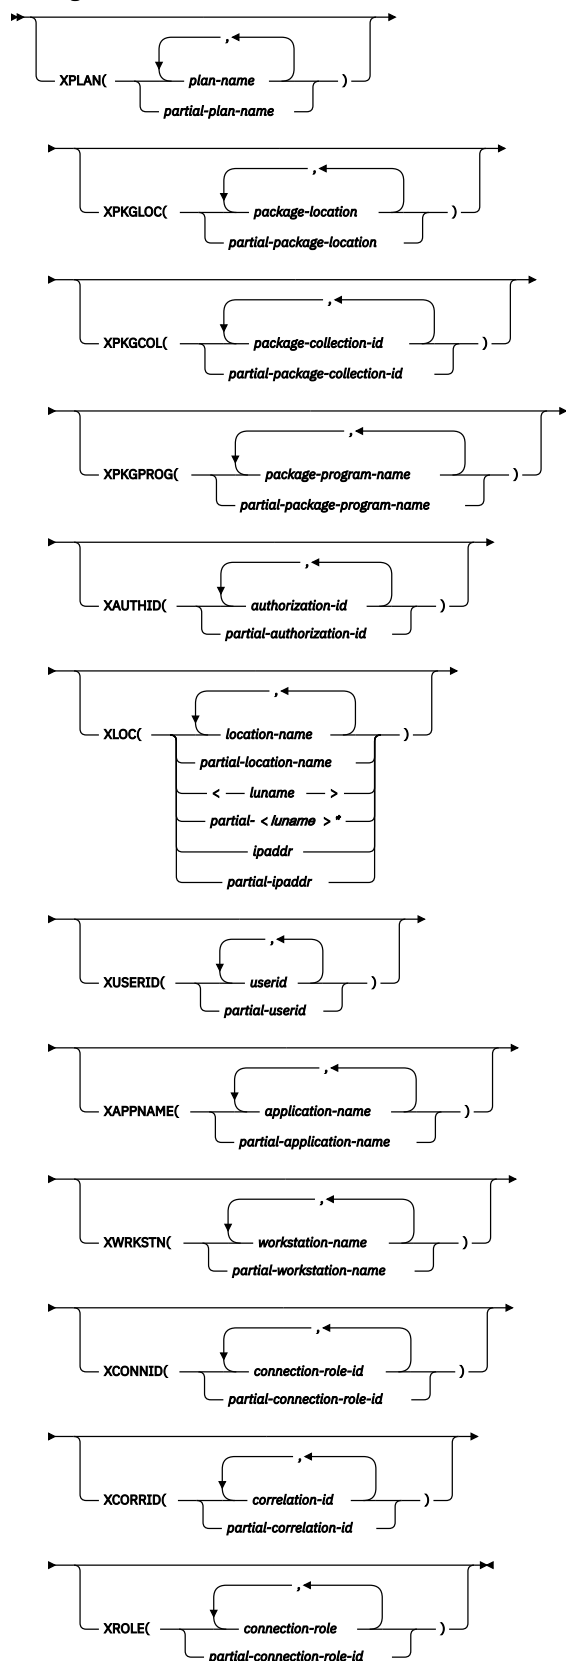

constraint block

Notes:

¹ AUDTPLCY applies to trace type AUDIT. You cannot specify CLASS or IFCID with AUDTPLCY.

filtering block

Option descriptions

None of the options are required. The command `DISPLAY TRACE` lists all active traces. Each option that is used, except `TNO`, limits the effect of the command to active traces that were started using the same option, either explicitly or by default, with exactly the same parameter values. For example, the following command lists only the active traces that were started using the options `PERFM` and `CLASS (1,2)`; it does *not* list, for example, any trace started using `CLASS(1)`.

```
-DISPLAY TRACE (PERFM) CLASS (1,2)
```

(*)

Does not limit the list of traces. The **default** is (*).

The `CLASS` option cannot be used with `DISPLAY TRACE (*)`.

Each of the following keywords limits the list to traces of the corresponding type.

Type (Abbrev)

Description

PERFM (P)

Performance records of specific events

ACCTG (A)

Accounting records for each transaction

STAT (S)

Statistical data

AUDIT (AU)

Audit data

MONITOR (MON)

Monitor data

DETAIL (*output-type*)

Limits the information that a trace displays based on the output type specified within parentheses.

The possible values for *output-type* are:

1

Display summary trace information: TRACE NUMBER, TYPE, CLASS, DEST

2

Display qualification trace information: TRACE NUMBER, AUTHID, LOCATION, PACKAGE, PLAN, TXACT, USERID, WORKSTATION

1,2

Display both summary and qualification information

Display both summary and qualification information

If no parameter follows `DETAIL`, type 1 trace information is displayed.

An additional column, `QUAL`, is also displayed, indicating whether the trace is qualified. Part of the summary trace information, the `QUAL` column can be used to determine if further qualification information for the trace is available. This information can be obtained by specifying `DETAIL (2)` or `DETAIL (*)`. A `QUAL` column value of `YES` indicates that additional information for this particular trace exists in the qualification trace information; a value of `NO` indicates that no additional information for this trace exists.

COMMENT (*string*)

Specifies that comment *string* appears in the trace output, except for the output in the resident trace tables.

string is any character string; it must be enclosed between apostrophes if it includes a blank, comma, or special character. The comment does not appear in the display; it can be recorded in trace output, but only if commands are being traced.

SCOPE

Specifies the scope of the command.

(LOCAL)

Displays the trace for the local member only.

(GROUP)

Displays the trace for all members in the data sharing group.

DEST

Limits the list to traces that were started for particular destinations. More than one value can be specified, but do not use the same value twice. If you do not specify a value for DEST, Db2 does not use the destination of where trace output is recorded to limit the list of traces displayed.

Abbreviation: D

Possible values and their meanings are:

Value

Trace destination

GTF

The generalized trace facility

SMF

The system management facility

SRV

An exit to a user-written routine

OP *n*

A specific destination. *n* can be a value from 1 to 8.

RMID

Specifies resource manager identifier. You can specify up to 8 valid RMIDs, which are one or two digit identifiers. You cannot specify RMID for accounting or statistic traces.

ASID(x'dddd')

Specifies that information about the trace for an address space is to be displayed.

dddd is a four-byte hexadecimal address space ID (ASID).

CLASS(*integer* , ...)

Limits the list to traces that were started for particular classes.

The **default** is CLASS (***), which does not limit the list.

TNO(*integer* , ...)

Limits the list to particular traces, identified by their trace numbers (1 to 32, 01 to 09). Up to eight trace numbers can be used. If more than one number is used, only one value each for PLAN, AUTHID, and LOCATION can be used.

The **default** is TNO (***), which does not limit the list.

PLAN(*plan-name* , ...) or XPLAN(*plan-name* , ...)

Introduces a list of specific plans for which trace information is gathered. Use PLAN to constrain the trace to the specified plans or XPLAN to exclude the specified plans. You cannot use this option for a STAT trace.

The **default** is PLAN (***) .

(*)**

Displays a trace for all plans.

plan-name

The name of an application plan. You can use up to eight names. If you use more than one name, you can use only one value for AUTHID and LOCATION.

PKGLOC or XPKGLOC

Specifies the location name where the package is bound. Use PKGLOC to constrain the trace to the specified locations or XPKGLOC to exclude the specified locations.

PKGCOL or XPKGCOL

Specifies the package collection name. Use PKGCOL to constrain the trace to the specified collections or XPKGCOL to exclude the specified collections.

PKGPROG or XPKGPROG

Specifies the DBRM or program name. Use PKGPROG to constrain the trace to the specified programs or XPKGPROG to exclude the specified programs.

AUTHID(*authorization-id* , ...) or XAUTHID(*authorization-id* , ...)

Introduces a list of specific authorization IDs for which trace information is gathered. Use AUTHID to constrain the trace to the specified authorization IDs or XAUTHID to exclude the specified authorization IDs. The authorization IDs specified must be the primary authorization IDs. You cannot use this option for a STAT trace.

The **default** is AUTHID(***).

(*)**

Displays a trace for all authorization IDs.

authorization-id

Specifies an authorization ID. You can use up to eight identifiers. If you use more than one identifier, you can use only one value for PLAN and LOCATION.

LOCATION(*location-name* , ...) or XLOC(*location-name* , ...)

Specifies a list of location names for which trace information is gathered. Use LOCATION to constrain the trace to the specified locations or XLOC to exclude the specified locations. The use of the LOCATION or XLOC option precludes tracing threads that have no distributed data relationship.

location-name

Identifies the Db2 subsystems whose distributed threads you want to trace. Activates the Db2 trace for the remote TCP/IP or SNA location that you specify by *location-name*.

You can specify up to eight locations. You can specify only one location if you use more than one plan name or authorization ID.

<*luname*>

Activates the Db2 trace for the remote clients that are connected to DDF through the remote SNA LU name that you specified in *luname*.

ipaddr

Activates the Db2 trace for the remote clients that are connected to DDF through the remote TCP/IP host. *ipaddr* is the IP address.

(*)**

Indicates that you want to display trace events that occur under distributed threads regardless of which location they are connected to. Specifying the local location name is equivalent to specifying LOCATION(***).

Clients other than Db2 for z/OS: Db2 for z/OS does not receive a location name from clients that are not Db2 for z/OS subsystems. To display a trace for a client that is not a Db2 for z/OS subsystem, enter its LUNAME or IP address. Enclose the LUNAME by the less-than (<) and greater-than (>) symbols. Enter the IP address in the form *nnn.nnn.nnn.nnn*. For example, to display a trace for a client with the LUNAME of LULA, enter the following command:

```
-DISPLAY TRACE (*) LOCATION (<LULA>)
```

To display a trace for a client with the IP address of 123.34.101.98, enter the following command:

```
-DISPLAY TRACE (*) LOCATION (::FFFF:123.34.101.98)
```

USERID or XUSERID

Specifies the user ID. Use USERID to constrain the trace to the specified user IDs or XUSERID to exclude the specified user IDs. You can specify multiple values and wildcard values as described in [Usage notes](#).

USERID and XUSERID can be up to 16 characters.

APPNAME or XAPPNAME

Specifies the application name. Use APPNAME to constrain the trace to the specified applications or XAPPNAME to exclude the specified applications. You can specify multiple values and wildcard values as described in [Usage notes](#).

APPNAME and XAPPNAME can be up to 32 characters.

WRKSTN or XWRKSTN

Specifies the workstation name. Use WRKSTN to constrain the trace to the specified workstations or XWRKSTN to exclude the specified workstations. You can specify multiple values and wildcard values as described in [Usage notes](#).

WRKSTN and XWRKSTN can be up to 18 characters.

CONNID or XCONNID

Specifies the connection ID. Use CONNID to constrain the trace to the specified connections or XCONNID to exclude the specified connections.

CORRID or XCORRID

Specifies the correlation ID. Use CORRID to constrain the trace to the specified correlation IDs or XCORRID to exclude the specified correlation IDs.

ROLE or XROLE

Specifies the connection roles. Use ROLE to constrain the trace to the specified roles or XROLE to exclude the specified roles.

AUDTPLCY

A 128-byte area that contains the policy name. You can specify up to eight audit policy names. AUDTPLCY applies to trace type AUDIT. You cannot specify CLASS or IFCID with AUDTPLCY.

Usage notes

Displaying traced threads using the * wildcard: You can use the wildcard suffix, "*" to filter threads that you want to display. For example, if you specify "-DISPLAY TRACE PLAN (A,B,C*)", Db2 will display traces A, B, CDE, CDEFG, CDEFGH, and so on. It will display traced threads "A", "B" and all threads starting with "C".

Displaying traced threads using the positional, () wildcard: You can use the positional wildcard, which is represented by the, "_" character, to display traced threads when you want the wildcard in the middle, or when you want to trace threads of a specific length. For example, if you specify "-DISPLAY TRACE PLAN (A_B)", all display all traced threads that have "A" as the first character, any character for the "_," and "C" as the plan filter.

Displaying multiple traced threads at once using wildcards: You also have the option of displaying multiple traced threads based on multiple trace qualifications. For example, you can specify, "-DISPLAY TRACE PLAN (A*, B*, C*)" to simultaneously display all traced threads for plan that start with "A", "B", and "C". The wildcard character, "*" will display all traced threads. You can specify more complex combinations such as, "-DISPLAY TRACE PLAN (A_B*, C*, AND C/_D*)", which will return all threads that:

- begin with "A", have a one character wild card as the second character in the thread, have a "B" as the third character in the thread, and end with any type or number of characters (**ADB**IOP, **AOBT**YJDP,)
- begin with "C", and end with any combination of characters (**C**DE, **CGH**KO)
- begin with "C_D" and end with any type of character combination (**C**_DEFGH, **C**_DIMNOP)

All of the possible thread combinations listed above will be returned with the command above.

You have the ability to filter multiple threads at the same time, setting specific criteria for the trace. For example, you can specify, “-DISPLAY TRACE PLAN (A) USERID (B).” This will display all traced threads where the plan thread is “A,” and the user ID is “B.” **Note:** When displaying traced threads, you can only specify one thread criteria for each filter for the display trace command. For example, you can specify “-DISPLAY TRACE PLAN(A,B) USERID (B) WRKSTN (E),” but you cannot specify “-DISPLAY TRACE PLAN(A, B) USERID(A, B) WRKSTN(E) because, in this example, two of the filter qualifications have two elements defined to be traced, and Db2 only allows for one attribute to have more than one trace element to be defined per trace.

Filtering traced threads that you want to display using exclude functionality: When you specify an “X” with any constraint keyword, such as “XPLAN”, when you are filtering threads, you are using the exclude functionality for the display trace command. You have the option of excluding specific types of threads you want to display when you are running trace commands. You can use the “X” character to exclude specific combinations of characters when you are running a display trace command. For example, you can specify “-DISPLAY TRACE XPLAN(A), to display all traced threads EXCEPT “A”. In this instance B, BCD, BCDE, or CD could possibly be returned.

You also have the option of excluding multiple types of threads from your trace. For example, you can specify, “-DISPLAY TRACE XPLAN (A*, B*) to display all traced threads EXCEPT those starting with “A”, with any combination of characters following “A”, and all those characters starting with “B”, with any combination of characters following “B”. Note: Specifying XPLAN (*) will exclude all threads from your search, and is not allowed. You also cannot use the wildcard in the middle of a display trace command with exclude functionality, such as, “-DISPLAY TRACE XPLAN (A*C).” You can, however, specify “-DISPLAY TRACE XPLAN (A_ _ C *)”, which will return all threads EXCEPT those starting with “A”, a variety of TWO characters next, a “C” in the fourth space, and a variety of characters at the end. The wildcard symbol cannot be placed in the middle of trace criteria.

You have the ability to display two traces at once, in order to help you optimize your tracing capabilities. For example, you can specify (-DISPLAY TRACE XPLAN (A, B, C) USERID (D)). This tells Db2 to display all threads that are being traced for “plan” EXCEPT threads “A”, “B”, or “C”, only where the user ID = “D”.

Combining trace qualifiers: You can customize the threads you trace by commanding Db2 to trace specific threads, while excluding other specific threads. For example, you can specify, “-DISPLAY TRACE USERID(A,B) XPLAN (C)” . This criteria only traces threads where the user ID is equal to “A” or “B”, and plan is NOT equal to “C”. In this example, a thread where the user ID is “A” and the plan is equal to “D” would pass, and be traced, but a thread where the user ID is “A” and plan is “C” would not pass, and would not be traced.

You can introduce wildcards into your display trace commands to add more customization to your traces. For example, you can specify “-DISPLAY TRACE PLAN (C*) USERID (Z, X) XPLAN (C, D, E)”. In this example, for the thread to be traced, the plan must begin with “C,” the user ID must be equal to “Z” or to “X,” and the plan cannot be “C,” “D,” or “E.” So a plan of “CB,” with a user ID of “Z” would pass, and the thread being traced would be displayed, but plan C with a user ID of “X” would fail because the command specifies not to trace threads where the plan is “C”, without additional characters in the thread.

DISPLAY TRACE return code when there are no active traces: If you run DISPLAY TRACE in a batch environment, and no traces are active, the return code for the job step is 12.

Output

Message [DSNW127I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Examples

Example: Listing all traces that have a specific destination

The following command lists all traces that have the generalized trace facility as their only destination.

```
-DISPLAY TRACE (*) DEST (GTF)
```

The output is similar to this output:

```
- 15.05.15 @DISPLAY TRACE (*) DEST (GTF)
- 15.05.15 STC00042 DSNW127I @ CURRENT TRACE ACTIVITY IS -
- TNO TYPE CLASS DEST QUAL IFCID
- 04 PERFM 01,02,03,23 GTF NO
- *****END OF DISPLAY TRACE SUMMARY DATA*****
- 15.05.15 STC00042 DSN9022I @ DSNWVCM1 '-DISPLAY TRACE' NORMAL COMPLETION
```

Example: Listing traces of a specific trace class

The following command lists all active performance traces.

```
-DISPLAY TRACE=P
```

The output is similar to this output:

```
- 15.10.12 @DISPLAY TRACE=P
- 15.10.12 STC00042 DSNW127I @ CURRENT TRACE ACTIVITY IS -
- TNO TYPE CLASS DEST QUAL IFCID
- 04 PERFM 01,02,03 GTF NO
- 05 PERFM 08 GTF NO
- *****END OF DISPLAY TRACE SUMMARY DATA*****
- 15.10.12 STC00042 DSN9022I @ DSNWVCM1 '-DISPLAY TRACE' NORMAL COMPLETION
```

Example: Listing all traces for threads that are connected to a specific location

The following command lists all active audit traces for threads that are connection to Db2 subsystem with location name USIBMSTODB23.

```
-DISPLAY TRACE(AUDIT) LOCATION(USIBMSTODB23)
```

The output is similar to this output:

```
- 15.21.03 STC00042 DSNW127I @ CURRENT TRACE ACTIVITY IS -
- TNO TYPE CLASS DEST QUAL IFCID
- 02 AUDIT 01 GTF YES
- 03 AUDIT 01 SMF YES
- *****END OF DISPLAY TRACE SUMMARY DATA*****
- 15.21.03 STC00042 DSN9022I @ DSNWVCM1 '-DISPLAY TRACE' NORMAL COMPLETION
```

Example: Listing all traces for a specific audit policy

The following command lists trace information for all audit traces that have GTF as their only destination and audit policy AUDITADMIN.

```
-DISPLAY TRACE (AUDIT) DETAIL (2) DEST (GTF) AUDTPLCY (AUDITADMIN)
```

The output is similar to this output:

```
- 15.46.36 STC00042 DSNW143I @ CURRENT TRACE QUALIFICATIONS ARE -
- 15.46.36 STC00042 DSNW152I @ BEGIN TNO 04 QUALIFICATIONS:
- NO QUALIFICATIONS
- END TNO 04 QUALIFICATIONS
- 15.46.36 STC00042 DSNW185I @ BEGIN TNO 04 AUDIT POLICIES:
- ACTIVE AUDIT POLICY: AUDITADMIN
- END TNO 04 AUDIT POLICIES
- 15.46.36 STC00042 DSNW148I @ *****END OF DISPLAY TRACE QUALIFICATION
- DATA*****
- 15.46.36 STC00042 DSN9022I @ DSNWVCM1 '-DISPLAY TRACE' NORMAL COMPLETION
```

Example: Using an filtering clause to display traces that do not have a specific criterion

The following command lists all active performance traces that are being written to SMF, and are not tracing activity for plan DSNREXX.

```
-DISPLAY TRACE(PERFM) DEST(SMF) XPLAN(DSNREXX)
```

The output is similar to this output:

```
- 16.02.20 STC00042 DSNW127I @ CURRENT TRACE ACTIVITY IS -
- TNO TYPE CLASS DEST QUAL IFCID
- 05 PERFM 01,02,03,23 SMF YES
```

```
- *****END OF DISPLAY TRACE SUMMARY DATA*****  
- 16.02.20 STC00042 DSN9022I @ DSNWVCM1 '-DISPLAY TRACE' NORMAL COMPLETION
```

Related reference**-STOP TRACE (Db2)**

The Db2 command STOP TRACE stops tracing.

-START TRACE (Db2)

The Db2 command START TRACE starts Db2 traces.

-MODIFY TRACE (Db2)

The Db2 command MODIFY TRACE changes the IFCIDs (trace events) associated with a particular active trace.

Chapter 38. -DISPLAY UTILITY (Db2)

The Db2 command DISPLAY UTILITY displays the status of utility jobs, including utility jobs in a data sharing group.

The output from the command consists of informational messages only. One set of messages is returned for each job identified by the command. For utility jobs in a data sharing group, the output shows the member name of the system on which each utility job is running.

The status from the display represents the current status, except in a data sharing group when the utility is running on a member other than the one from which the command is issued. In that case, the status is current as of the last checkpoint.

Abbreviation: -DIS UTIL

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or member, depending on which option you choose.

To use the DISPLAY UTILITY command for BACKUP SYSTEM on a data sharing group, issue the command from the member on which the BACKUP SYSTEM utility is invoked. Otherwise, the current utility information is not displayed.

Authorization

None is required.

Syntax

Option descriptions

Use at least one of the following options but do not use the same option more than once.

(utility-id)

Identifies a single job by its utility identifier, the value given for the UID parameter when the job was created.

If *utility-id* was created by the DSNU CLIST by default, it has the form of *tso-userid.control-file-name*.

If *utility-id* was omitted when the utility job was created, *utility-id* has the form *userid.jobname*.

If *utility-id* contains lowercase letters or special characters, it must be enclosed in single quotation marks (').

(*partial-utility-id)**

Identifies a set of utility jobs. A status message is shown for each utility identifier that begins with the characters of *partial-utility-id*.

For example, `-DISPLAY UTILITY(ABCD*)` shows the status of every utility job known to Db2 whose identifier begins with the characters ABCD.

(*)

Shows the status of all utility jobs known to Db2, including jobs currently running in a data sharing group.

MEMBER (*member-name* , ...)

Restricts the display for the identified utility jobs to specific members of the data sharing group. The default is to display utility jobs running on any member. In a non-data-sharing environment, the option is ignored.

One set of messages is returned for each job identified by the command.

Usage notes**DISPLAY status**

The status displayed in the returned message is the status at the time the Db2 utility function received the command. Execution has proceeded, therefore the current state of the utility can be different from the state reported. For instance, the `DISPLAY UTILITY` command can indicate that a particular utility identifier is active, but, when the message is received by the requester, the utility job step could have terminated so that the utility identifier is no longer known to Db2.

Command response

In a data sharing environment, messages DSN100I, DSN105I, DSN106I show the name of the member on which the utility job is running. If you specify a single member name in the `MEMBER` option and that member does not belong to the group, or if you specify a list of member names in the `MEMBER` option and none of those members belong to the group, the command fails and a message is issued.

Output

Message [DSNU100I \(Db2 Messages\)](#) indicates the beginning of the output of the command.

Examples**Example: Displaying the status of all utility jobs in a single Db2 subsystem**

The following command displays status information for all utility jobs that are currently known to a Db2 subsystem.

```
-DISPLAY UTILITY(*)
```

The output is similar to the following output.

```
DSNU100I - DSNUGDIS - USERID = SAMPID
          MEMBER =
          UTILID = RUNTS
          PROCESSING UTILITY STATEMENT 1
          UTILITY = RUNSTATS
          PHASE = RUNSTATS    COUNT = 0
          STATUS = STOPPED
          STATUS = STOPPED
          JOBNAME = STATSJB
DSN9022I - DSNUGCC  '-DISPLAY UTILITY' NORMAL COMPLETION
```

Example: Displaying the status of all utility jobs in a Db2 data sharing group

The following command displays status information for all utility jobs that are currently known to a Db2 data sharing group.

```
-DB1G DISPLAY UTILITY (*)
```

The output is similar to the following output.

```
DSNU100I -DB1G DSNUGDIS USER = SAMPID
          MEMBER = DB1G
          UTILID = RUNTS
          PROCESSING UTILITY STATEMENT 1
          UTILITY = RUNSTATS
          PHASE = RUNSTATS COUNT = 0
          STATUS = STOPPED
          JOBNAME = STATSJB
          TIME STARTED = 2014-01-09-10:23:20
DSNU100I -DB1G DSNUGDIS USER = SAMPID
          MEMBER = DB2G
          UTILID = CHKIX1
          PROCESSING UTILITY STATEMENT 8
          UTILITY = CHECK
          PHASE = UNLOAD COUNT = 0
          STATUS = STOPPED
          JOBNAME = CHECKJB
          TIME STARTED = 2014-01-09-10:30:30
DSN9022I -DB1G DSNUGCC '-DB1G DISPLAY UTILITY' NORMAL COMPLETION
```

Example: Displaying the status of utilities on a specific data sharing member

The following command displays the status of utilities on data sharing member DB1G.

```
-DB1G DISPLAY UTILITY (*) MEMBER (DB1G)
```

The output is similar to the following output.

```
DSNU105I -DB1G DSNUGDIS - USERID = SYSADM 973
          MEMBER = DB1G
          UTILID = REORGCP
          PROCESSING UTILITY STATEMENT 1
          UTILITY = REORG
          PHASE = LOG COUNT = 0
          STATUS = ACTIVE
          JOBNAME = REORGJB
          TIME STARTED = 2014-01-09-10:23:20
DSNU347I -DB1G DSNUGDIS - 974
          DEADLINE = NONE
DSNU384I -DB1G DSNUGDIS - 975
          MAXRO = DEFER
          LONGLOG = CONTINUE
          DELAY = 1200 SECONDS
DSNU285I -DB1G DSNUGDIS - 976
          SWITCHTIME = 2014-01-09-14:32:15
          NEWMAXRO = 30 SECONDS
DSNU383I -DB1G DSNUGDIS - CURRENT ITERATION NUMBER = 4 977
WRITE ACCESS ALLOWED IN THIS ITERATION = YES
ITERATION BEFORE PREVIOUS ITERATION:
  ELAPSED TIME = 00:00:00
  NUMBER OF LOG RECORDS PROCESSED = 0
PREVIOUS ITERATION:
  ELAPSED TIME = 00:00:00
  NUMBER OF LOG RECORDS PROCESSED = 0
CURRENT ITERATION:
  ESTIMATED ELAPSED TIME = 00:00:00
  ACTUAL ELAPSED TIME SO FAR = 00:00:00
  ACTUAL NUMBER OF LOG RECORDS BEING PROCESSED = 0
CURRENT ESTIMATE FOR NEXT ITERATION:
  ELAPSED TIME = 00:00:00
  NUMBER OF LOG RECORDS TO BE PROCESSED = 0
DSN9022I -DB1G DSNUGCC '-DIS UTIL' NORMAL COMPLETION
```

Chapter 39. DSN (TSO)

The TSO command DSN starts a DSN session.

For a list of commands that you can issue under the TSO command DSN, see [Chapter 2, “Command types and environments in Db2,”](#) on page 9.

DSN subcommands

The DSN command has the following subcommands:

[ABEND \(DSN\)](#)

The DSN subcommand ABEND causes the DSN session to terminate with abend completion code X'04E' and reason code of X'00C50101'.

Important: The ABEND subcommand is used for diagnostic purposes only, and is intended to be used only under the direction of IBM Support. Use it only when diagnosing a problem with DSN or Db2.

[BIND PACKAGE \(DSN\)](#)

The DSN subcommand BIND PACKAGE builds an application package. Db2 records the description of the package in the catalog tables and saves the prepared package in the directory. BIND PACKAGE also deletes phased-out package copies.

[BIND SERVICE \(DSN\)](#)

The BIND SERVICE (DSN) subcommand builds an application package that represents a Db2 REST service.

[BIND PLAN \(DSN\)](#)

The DSN subcommand BIND PLAN builds an application plan. All Db2 programs require an application plan to allocate Db2 resources and support SQL requests made at run time.

[BIND QUERY \(DSN\)](#)

The DSN subcommand BIND QUERY reads the statement text, default schema, and a set of bind options from every row of DSN_USERQUERY_TABLE, and information from correlated EXPLAIN table rows. When LOOKUP(NO) is in effect, Db2 inserts the pertinent data into certain catalog tables.

[DSN \(TSO\)](#)

The TSO command DSN starts a DSN session.

[END \(DSN\)](#)

The DSN subcommand END is used to end the DSN session and return to TSO.

[FREE PACKAGE \(DSN\)](#)

The DSN subcommand FREE PACKAGE can be used to delete a specific version of a package, all versions of a package, or whole collections of packages.

[FREE SERVICE \(DSN\)](#)

The FREE SERVICE (DSN) subcommand deletes an application package that represents a Db2 REST service.

[FREE PLAN \(DSN\)](#)

The DSN subcommand FREE PLAN deletes application plans from Db2.

[FREE QUERY \(DSN\)](#)

The DSN subcommand FREE QUERY removes from certain catalog tables for one or more queries. If any of the specified queries are in the dynamic statement cache, FREE QUERY purges them from the dynamic statement cache.

[Chapter 42, “FREE STABILIZED DYNAMIC QUERY \(DSN\),” on page 331](#)

The DSN subcommand FREE STABILIZED DYNAMIC QUERY removes from certain catalog tables one or more stabilized dynamic queries. If any of the specified queries are in the dynamic statement cache, FREE STABILIZED DYNAMIC QUERY purges the statements from the dynamic statement cache.

[DCLGEN \(DECLARATIONS GENERATOR\) \(DSN\)](#)

The declarations generator (DCLGEN) produces an SQL DECLARE TABLE statement and a COBOL, PL/I, or C data declaration for a table or a view named in the catalog.

[REBIND PACKAGE \(DSN\)](#)

The DSN subcommand REBIND PACKAGE rebinds an application package when you make changes that affect the package, but have not changed the SQL statements in the program.

[REBIND PLAN \(DSN\)](#)

The DSN subcommand REBIND PLAN rebinds an application plan when you make changes to the attributes of the plan, such as the package list.

[REBIND TRIGGER PACKAGE \(DSN\)](#)

The DSN subcommand REBIND TRIGGER PACKAGE rebinds a package for a basic trigger. You can identify basic triggers by querying the SYSIBM.SYSTRIGGERS catalog table. Blank values in the SQLPL column identify basic triggers. For advanced triggers, use the REBIND PACKAGE command instead.

[RUN \(DSN\)](#)

The DSN subcommand RUN executes an application program, which can contain SQL statements.

[SPUFI \(DSN\)](#)

The DSN subcommand SPUFI executes the SQL processor using file input.

During a DSN session, you can also enter Db2 commands, except for START DB2. Db2 commands must start with a hyphen (-). For detailed descriptions of the Db2 commands, see the commands with names that are preceded by the recognition character "-" and followed by "(Db2)" under [Part 1, “About Db2 and related commands,” on page 1](#).

You can also enter comments by starting them with an asterisk (*).

During a DSN session, you can also issue TSO commands, except for FREE, RUN, TEST, and TIME. To use TSO TEST to debug an application program, run it with the DSN command; for example:

```
TEST '
prefix
.SDSNLOAD(DSN)' CP
```

Important: The ABEND subcommand is used for diagnostic purposes only, and is intended to be used only under the direction of IBM Support. Use it only when diagnosing a problem with DSN or Db2.

Percent commands are not recognized during a DSN session, they are only supported by the TSO command processor.

Environment

A DSN session runs under TSO in either foreground or background mode. When you run it in background mode, you are not prompted for corrections or additional required information.

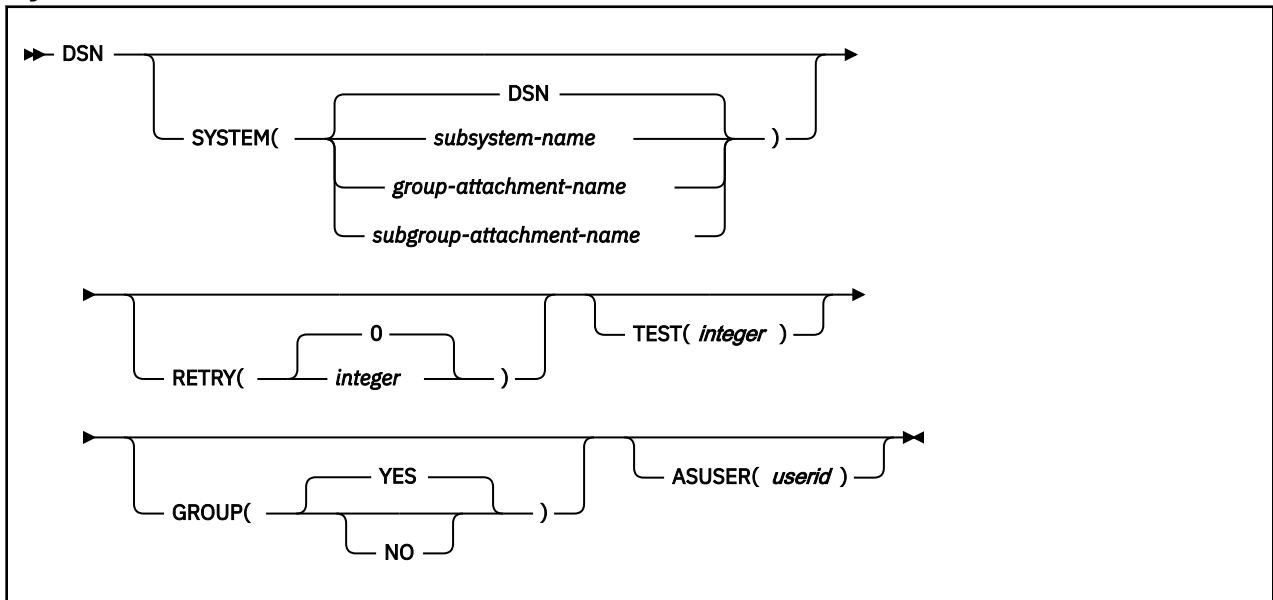

You can also start a DSN session from a CLIST running in either foreground or background mode.

Data sharing scope: Member

Authorization

None is required for the DSN command, but authorization is required for most subcommands.

Syntax

Option descriptions

None of the following options are required.

SYSTEM

(**subsystem-name**)

Specifies the name of the Db2 subsystem.

(**group-attachment-name**)

Specifies the group attachment name of the data sharing group.

(**subgroup-attachment-name**)

Specifies the subgroup attachment name of the data sharing group.

The **default** is **SYSTEM(DSN)**. This value can be modified during Db2 installation.

RETRY(integer)

Specifies the number (integer) of additional times connection to the Db2 subsystem should be attempted if Db2 is not up or the maximum number of batch connections has been reached when DSN is issued. Retries occur at 30-second intervals.

The **default** is **RETRY(0)**. The maximum number of retries is 120.

TEST(integer)

Specifies the last two digits (integer) of the module name in order to trace a single DSN module. Specify a number greater than 100 to trace all DSN modules. DSN trace information messages are written to the TSO SYSTSPRT DD statement, and optionally, to the DSNTRACE DD statement.

GROUP

(**YES**)

Specifies that group attachment processing is considered when the system is not active.

(**NO**)

Specifies that group attach processing is not considered.

ASUSER(userid)

Specifies a user ID to associate with the trusted connection for the current DSN session.

A trusted connection is established if the primary authorization ID and jobname matches a trusted context defined in Db2. The user ID that you specify as ASUSER goes through the standard

authorization and connection exit processing to pick up the primary and secondary IDs. If the primary authorization ID is allowed to use the trusted connection without authentication, Db2 establishes the trusted connection for the ASUSER user ID. The primary authorization ID, any secondary authorization IDs, and any role associated with the ASUSER user ID are now in effect for the trusted connection.

If the primary authorization ID associated with the user ID that you specify in the ASUSER option is not allowed to use the trusted connection or requires authentication information the connection request fails.

Db2 retains the ASUSER value only for the life of the DSN session.

Usage notes

Beginning a DSN session: Issue the DSN command to begin a DSN session, which allows you to enter DSN subcommands. The following rules govern the session:

- In foreground operation, you are prompted for input by the prompt string DSN at the terminal. In background mode, your input is read from the SYSTSIN data set.
- Except for delimited table names in the DCLGEN command, input in lowercase letters is changed to uppercase.
- If duplicate keywords of any subcommand are specified, only the last of these keywords is processed. For example, if both MEMBER(*dbrm-member-name1*) and MEMBER(*dbrm-member-name2*) are specified with BIND PLAN, Db2 receives only the latter, MEMBER(*dbrm-member-name2*).
- If ATTENTION (PA1) is pressed during a DSN session, and PROMPT is specified in the TSO user profile, message DSNE005 appears: EXECUTION IS INTERRUPTED, ENTER C TO CANCEL, OR ANY OTHER REPLY TO RESUME THE *subcommand* SUBCOMMAND.

If you enter C, the current subcommand is canceled and the current Db2 connection terminates; a new one is established, and another DSN prompt appears. Any other reply, except ATTENTION, causes the current subcommand to continue from the point at which it was interrupted.

If a DSN session is started from a CLIST, or a CLIST is executed under DSN, CONTROL PROMPT must be specified in the CLIST in order to receive message DSNE005.

- After a command is processed during a DSN session, you are prompted for input. That cycle continues until you end the session.
- You can end the session by taking one of the following actions:
 - Issue the END subcommand. Control is passed to TSO.
 - Press ATTENTION and respond to the message by pressing ATTENTION again.
 - Issue another DSN command. The old session ends and a new one begins.

DSN return code processing: At the end of a DSN session, register 15 contains the highest value used by any DSN subcommand in the session or by any program run using the RUN subcommand. Your run time environment might format that value as a return code. The value does not, however, originate in DSN.

Establishing trusted context using TSO and DB2I: DB2I runs under TSO using ISPF services. The DB2I facility provides an ISPF front end for tools such as SPUFI and DCLGEN and tasks such as preparing Db2 programs and binding plans and packages. The DB2I Defaults Panel includes the field AS USER. Use the AS USER field to specify an authorization name to use for the current session that is associated with the trusted connection. The trusted connection is established when the TSO logon ID matches the system authorization ID and jobname defined for a trusted context. The ASUSER field is always blank on entry to DB2I. If you enter a value in the AS USER field it is passed to all TSO attach (DSN) calls by using the ASUSER option of the DSN (TSO) command.

Attachment facilities for monitors: For long-running programs such as monitors, use a programmable attachment facility like CAF or RRSAF, instead of using the Db2 TSO attachment facility. The TSO attachment facility is not designed for use in a long-running program. Use of the TSO attachment facility for that type of program might cause storage or recovery problems.

Examples

Example: Starting a DSN session with multiple retry attempts

The following command starts a DSN session. If the attempt to connect to Db2 fails, up to five retries, at 30 second intervals, are made.

```
DSN SYSTEM (DB2) RETRY (5)
```

Example: Starting a DSN session, running a program, and ending a DSN session

The following example shows the commands to start a DSN session, run a program, and end the DSN session.

```
TSO prompt : READY
USER enters: DSN SYS(SSTR)
DSN prompt : DSN
USER enters: RUN PROGRAM(MYPROG)
DSN prompt : DSN
USER enters: END
TSO prompt : READY
```

Chapter 40. DSNH (TSO CLIST)

The DSNH command procedure (a TSO CLIST) is a powerful yet easy method of preparing an application program for execution.

The DSNH command procedure (a TSO CLIST) prepares a program for execution, and executes it if it runs under TSO. By issuing a single command, you can select numerous options required for the preparation of an application and execute it under TSO.

DSNH processing is a sequential process that can include any of the actions listed in the following table.

Individual steps or a sequence of steps can be performed, and you can end the process at any point you choose. Any steps in the process that are skipped must have previously been completed successfully by DSNH.

Table 13. DSNH actions and the corresponding step names

For invoking the...	Use step name
PL/I macro processor	MP
Db2 precompiler	PC
CICS command language translator	TR
DSN BIND PLAN subcommand for binding a plan	BI
DSN BIND PACKAGE subcommand for binding a package	BP
Compiler or assembler for your program	CO
A C compiler prelink utility for including compile-time parameters	PL
Link-editor to produce an executable load module	LE
DSN RUN subcommand to execute the program	RU
Note: The step names are used in the heading of Table 15 on page 300 .	

Environment

The DSNH CLIST can run in TSO foreground or in batch under the TSO terminal monitor program. DB2I uses the DSNH CLIST on the precompiler panel to control program preparation. You can pass DSNH parameters from DB2I panels on the "Other options" lines.

Data sharing scope: Member

Authorization

DSNH requires no special authorization. However, if DSNH binds a package or plan, or runs a plan, authorization is required to perform those actions:

- See the BIND PACKAGE authorization information for the privileges that are necessary to bind a package.
- See the BIND PLAN authorization information for the privileges that are necessary to bind a plan.
- See the RUN authorization information for the privileges that are necessary to run a plan.

Syntax

Summary of DSNH CLIST parameters

The CLIST parameters provide the processing options for each step; specify them when you execute DSNH. Some parameters are used for more than one step, as indicated in [Table 15 on page 300](#). This table shows where each parameter is used, using the following notation:

- Y in any cell shows that the option listed at the beginning of the row is used in the step whose name appears at the top of the column.
- * in any cell indicates that the option listed at the beginning of the row is used in *another* step which affects the step whose name appears at the top of the column.

Notation of CLIST parameters for the BIND PLAN and BIND PACKAGE steps: Many parameters of BIND PLAN and of BIND PACKAGE provide the same function and are spelled alike. CLIST parameters for BIND PLAN and BIND PACKAGE are differentiated from general parameters and from each other by prefixes. A parameter name prefixed by the letter B applies to the BIND PLAN subcommand; a parameter name prefixed by the letter P applies to BIND PACKAGE. The following table shows the possible variations for a single parameter name.

Table 14. DSNH CLIST prefixing rules

Parameter value	Function or subcommand	Example
<i>parameter</i>	If no prefix is specified, the parameter applies to a single function or subcommand.	DBRMLIB
<i>B/parameter</i>	The prefix B is used to indicate that this variation of the parameter applies only to the BIND PLAN step.	B/DBRMLIB
<i>P/parameter</i>	The prefix P is used to indicate that this variation of the parameter applies only to the BIND PACKAGE step.	P/DBRMLIB

In the following table, a prefix is separated from the Db2 parameter name by a slash (/). Refer to [Table 13 on page 299](#) for an explanation of the two-letter step names.

General parameter descriptions

Due to similarities in name and function, the CLIST parameters for BIND PLAN and BIND PACKAGE are described separately from the parameters in [Table 16 on page 305](#). For a summary of:

- BIND PLAN parameters, refer to [Table 17 on page 318](#)
- BIND PACKAGE parameters, refer to [Table 18 on page 321](#)

The only parameter that is required on the DSNH statement is INPUT; the others are optional. In [Table 16 on page 305](#):

- Parameter values must be enclosed between parentheses.
- Parameter values need not be enclosed between apostrophes, except in either of the following cases:
 - If the value is a list of tokens with separators, the value must be enclosed between apostrophes.
 - If the value is a data set name, your user identifier is added as a prefix. To avoid the prefix, enclose the data set name between sets of three apostrophes.
- Most parameter values that are data set names (*dsname*) cannot include member names. Exceptions are noted in the parameter descriptions.
- Underlined values are defaults. Default names can be changed to names specific to your site when Db2 is installed.

Table 16. General DSNH CLIST parameters

Parameter	Value	Comments
ASMLIB	<i>dsname</i>	Specifies a data set to be used as the standard MACLIB for High Level Assembler. The default is <code>'''SYS1.MACLIB'''</code> .
ASMLOAD	<i>dsname</i>	Specifies a data set that contains the High Level Assembler load module. <i>dsname</i> can include a member name. The default is <code>'''SYS1.LINKLIB(ASMA90)'''</code> .
CCLINK	<i>dsname</i>	Specifies a data set that contains the IBM Language Environment® prelink editor utility invocation load module that is to be used for preparing C programs. <i>dsname</i> can include a member name. The default is <code>'''CEE.SCEERUN(EDCPRLK)'''</code> .
CCLLIB	<i>dsname</i>	Specifies a data set that contains the linkage editor include modules for the C compiler routines. The default is <code>'''CEE.SCEELKED'''</code> .
CCLOAD	<i>dsname</i>	Specifies a data set that contains the C compiler invocation load module. <i>dsname</i> can include a member name. The default is <code>'''CBC.SCCNCMP(CCNDVR)'''</code> .
CCMSG	<i>dsname</i>	Specifies a data set that contains the C compiler messages. This data set is required only for C/370. <i>dsname</i> can include a member name. The default is <code>'''EDC.V1R2M0.SEDCDMSG(EDCMSGE)'''</code> .
CCSID	<i>integer</i>	Specifies the CCSID for source SQL statements.

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
CCOLIB	<u>NONE</u> <i>dsname</i>	Specifies that the data set that contains C object modules is included during the execution of the prelink utility step.
CCPLIB	<u>NONE</u> <i>dsname</i>	Specifies a data set that contains include modules for PL/I routines. This parameter is used only for IBM C/370 Version 2 or earlier.
CCPMSG	<i>dsname</i>	Specifies a data set that contains the message library that is to be used by the IBM prelink editor when preparing C programs. The default is "'CEE.SCEEMSGP(EDCPMSG)'".
CCSLIB	<i>dsname</i>	Specifies a data set that contains the C compiler headers. The default is "'CEE.SCEEH.H'".
CICSOPT	<u>NONE</u> <i>option-list</i>	Specifies a list of additional CICS translator options. See the appropriate CICS application programming reference for information about translator options. The default , NONE, specifies no additional options.
CICSPRE	<i>prefix</i>	Specifies the prefix for the CICS libraries. The library names are: <i>prefix</i> .LOADLIB for translators <i>prefix</i> .PL1LIBn for PL/I include <i>prefix</i> .COBLIB for COBOL include Leave this parameter blank to use CICSLLIB, CICSPLIB, CICSJOB. The default is blank.
CICSLLIB	<i>dsname</i>	Specifies the CICS load library. To use this library, leave the CICSPRE parameter blank. The default is set on installation panel DSNTIP3.
CICSPLIB	<i>dsname</i>	Specifies the CICS PL/I library. To use this library, leave the CICSPRE parameter blank. The default is set on installation panel DSNTIP3.
CICSJOB	<i>dsname</i>	Specifies the CICS COBOL library. To use this library, leave the CICSPRE parameter blank. The default is set on installation panel DSNTIP3.
CICSVER	21 31 <u>33</u> 41	Specifies the CICS release. This field is ignored because current releases of CICS do not require DSNH to handle release-specific considerations.
CICSXLAT	NO YES	Specifies whether to execute the CICS command translator. This parameter is effective only if you use RUN(CICS). You cannot use this parameter with the MARGINS option of the translator. The default is YES. The DB2I panel default is NO.

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
CLIB C <i>n</i> LIB	<u>NONE</u> <i>dsname</i>	Specifies a data set that contains host language source statements to be included by the compiler or assembler. The parameters C <i>n</i> LIB (where <i>n</i> can be 2, 3, or 4) are extensions of CLIB, which is used to simplify passing a list of data set names. Use the default , NONE, to specify no data set.
COBICOMP	<i>dsname</i>	Specifies the IBM COBOL data set that is required for compilation. The default is "'IGY.SIGYCOMP'".
COBILINK	<i>dsname</i>	Specifies the IBM COBOL data set that is required for link edit. The default is "'CEE.SCEELKED'".
COBIPLNK	<i>dsname</i>	Specifies a data set that contains the IBM Environment prelink editor utility invocation load module that is to be used for preparing COBOL programs. <i>dsname</i> can include a member name. The default is "'CEE.SCEERUN(EDCPRLK)'".
COBIPMSG	<i>dsname</i>	Specifies a data set that contains the message library that is to be used by the IBM prelink editor when preparing COBOL programs. <i>dsname</i> can include a member name. The default is "'CEE.SCEEMSGP(EDCPMSG)'".
COBLIB	<i>dsname</i>	Specifies the linkage editor include library that is to be used for OS/VS COBOL routines. This parameter is obsolete.
COBLOAD	<i>dsname</i>	Specifies a data set that contains the OS/VS COBOL compiler load module. This parameter is obsolete.
COBSOM	<i>dsname</i>	Specifies the IBM System Object Model (SOM) data set that is required for access to SOM objects. This parameter is obsolete.
COB2CICS	<i>dsname</i>	Specifies the linkage editor include library that is to be used for VS COBOL II CICS routines. This parameter is obsolete.
COB2LIB	<i>dsname</i>	Specifies the linkage editor include library that is to be used for the VS COBOL II or COBOL/370 routines. This parameter is obsolete.
COB2LOAD	<i>dsname</i>	Specifies a data set that contains the VS COBOL II or COBOL/370 compiler load module. This parameter is obsolete.

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
COMPILE	<u>YES</u> NO	Specifies whether to execute the compiler or assembler if the precompile step is successful.
CONNECT	(1) (2)	Specifies whether a CONNECT SQL statement should be processed as a type 1 CONNECT or a type 2 CONNECT statement. The DSNH(TSO CLIST) command does not accept the CT(1) and CT(2) abbreviations for this precompiler option. The default is CONNECT(2).
CONTROL	<u>NONE</u> CONLIST LIST SYMLIST	Specify to help you trace the allocation of non-existent data sets. Use this parameter if you have a problem without an obvious cause. CONLIST displays CLIST commands after substitution for symbols and before command execution. LIST displays TSO commands after substitution for symbols and before command execution. SYMLIST displays all executable statements (TSO commands and CLIST statements) before substitution for symbols.
COPTION	<u>NONE</u> <i>string</i>	Specifies a list of compiler or assembler options. For more information, refer to the manual that describes the compiler or assembler options for the specific language you are using. For a list of restrictions on some options, see COBOL Options . NONE specifies no options.
CPPCLASS	<i>dsname</i>	Specifies the data set that contains C++ class libraries. The default is "'CBC.SCLBCPP'".
CPPCLINK	<i>dsname</i>	Specifies the data set that contains the IBM Language Environment prelink editor utility invocation load module that is to be used for preparing C programs. The default is "'CEE.SCEERUN(EDCPRLK)'".
CPPCLLIB	<i>dsname</i>	Specifies the data set for the C linkage editor automatic call library that is used by the C++ compiler. The default is "'CEE.SCEELKED'".
CPPCSLIB	<i>dsname</i>	Specifies a data set that contains the C compiler headers that are used by the C++ compiler. The default is "'CEE.SCEEH.H'".
CPPLLIB	<i>dsname</i>	Specifies a data set that contains the C++ prelink automatic call library. The default is "'CEE.SCEECPP'".
CPPPMMSG	<i>dsname</i>	Specifies the data set that contains the message library that is to be used by the IBM prelink editor when preparing C++ programs. <i>dsname</i> can include a member name. The default is "'CEE.SCEEMSGP(EDCPMSG)'".

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
CPPSLIB	<i>dsname</i>	Specifies the data set that contains C++ header files for class libraries. The default is "'CBC.SCLBH.HPP'".
CPPUTIL	<i>dsname</i>	Specifies the data set that contains procedures to set up and execute the C++ compiler. The default is "'CBC.SCCNUTL'".
DATE	ISO JIS USA EUR LOCAL	Specifies the format of date values that are to be returned, which overrides the format that is specified as the location default. The default is the value that is supplied when Db2 is installed, and is written in the data-only application defaults load module.
DBRMLIB	<u>DEFAULT</u> <i>dsname(member)</i> NONE	Specifies the partitioned data set, and an optional member name, that contains the DBRM library and member name that is used during the Db2 precompile step. Because you can specify individual DBRM member and library names during each individual phase, you must use the DBRMLIB parameter and associated prefixes to identify a specific phase. DBRMLIB specifies the DBRM library and member that is defined on the DBRMLIB DD statement during Db2 precompiler processing. DEFAULT indicates that the same DBRM library data set that is defined for the Db2 precompiler process (DBRMLIB(<i>parameter</i>)) is also used on the LIBRARY(<i>dsname</i>) subcommand keyword. If the precompiler DBRMLIB is not specified, the default generated DBRMLIB library that is based on the INPUT data set name is used. <i>dsname</i> is generated using the DSNH OUTNAME parameter value, or its default, TEMP, with the constant DBRM appended to the prefix; for example, <i>outname</i> .DBRM or TEMP.DBRM. <i>member</i> is obtained from the data set member name that is specified on the DSNH INPUT parameter or from the data set name as follows: <ul style="list-style-type: none"> Given INPUT(<i>outname</i>.DBRM(<i>dbrmmem</i>)): <ul style="list-style-type: none"> <i>outname</i>.DBRM(<i>dbrmmem</i>) - If the member name is specified <i>outname</i>.DBRM(<i>dbrm</i>) - If no member name is specified NONE indicates that no LIBRARY(<i>dsname</i>) subcommand keyword is specified on invocation.
DECARTH	<u>DEFAULT</u> 15 31	Specifies the maximum precision of decimal numbers. DEFAULT designates the value chosen, during installation, for the DECIMAL ARITHMETIC field on the APPLICATION PROGRAMMING DEFAULTS panel. A value of 15 specifies that decimal arithmetic operations on decimal values with precision 15 or less are performed in accordance with the existing rules for determining the precision and scale of the result. A value of 31 specifies that decimal arithmetic operations on decimal values with precision 15 to 31 are performed in accordance with new rules for determining the precision and scale of the result. DECARTH is ignored for Fortran.

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
DECIMAL	COMMA PERIOD	<p>Specifies the decimal point indicator for decimal and floating point literals. DECIMAL is valid only for COBOL programs; PERIOD is forced for all other programs.</p> <p>COMMA makes the indicator a comma.</p> <p>PERIOD makes the indicator a period.</p> <p>The default is the value of the DECIMAL POINT field, set on the Db2 APPLICATION PROGRAMMING DEFAULTS panel during installation.</p>
DELIMIT	<u>DEFAULT</u> APOST QUOTE	<p>Specifies the APOST or QUOTE precompiler option to indicate the string delimiter that is used within host language statements. DELIMIT is effective only for COBOL programs; APOST is forced for all other programs.</p> <p>DEFAULT designates the value chosen during installation for the STRING DELIMITER field on the APPLICATION PROGRAMMING DEFAULTS panel.</p> <p>APOST specifies the apostrophe as the string delimiter for host language statements.</p> <p>QUOTE specifies a quotation mark as the string delimiter for host language statements.</p>
ENTRY	<i>entry-name</i>	<p>Specifies the entry point that is assigned by the linkage editor.</p> <p>The default depends on the host language and the value of RUN.</p> <ul style="list-style-type: none"> For the PL/I language, the ENTRY value default is: <ul style="list-style-type: none"> NONE if the RUN value is CICS PLISTART for any other RUN value. For assembler language, the ENTRY value default is DLITASM if the RUN value is IMS. For COBOL, the ENTRY value default is DLITCBL if the RUN value is IMS. For any other language, the ENTRY value default is NONE (no specified entry point) for any RUN value.
FLAG	<u>I</u> C E W	<p>Specifies the messages that you want to see. Use one of the following values to show messages of the corresponding types:</p> <p>I All informational, warning, error, and completion messages</p> <p>W Only warning, error, and completion messages</p> <p>E Only error and completion messages</p> <p>C Only completion messages</p>

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
FORTLIB	<i>dsname</i>	Specifies the linkage editor include library that is to be used for Fortran routines. The default is "'SYS1.VSF2FORT'".
FORTLOAD	<i>dsname</i>	Specifies a data set that contains the VS Fortran compiler load module. <i>dsname</i> can include a member name. The default is "'SYS1.VSF2VCOMP(FORTVS2)'".
HOST	ASM C CPP IBMCOB FORTRAN PLI	Defines the host language within which SQL statements are embedded. COBOL and COB2 are also acceptable values but are obsolete. If your program is one of the following types of programs, you cannot use DB2I to prepare it: <ul style="list-style-type: none"> • A COBOL program that uses object-oriented extensions • A C++ program that uses object-oriented extensions and consists of more than one compilation unit The default is the value of the LANGUAGE DEFAULT field, set on the Db2 APPLICATION PROGRAMMING DEFAULTS panel during installation.
IMSPRE	<i>prefix</i>	Specifies the prefix for RESLIB, which is used for routines that are to be included by the linkage editor for IMS. The default is IMSVS.
INPUT	<i>dsname</i>	Specifies the data set that contains the host language source and SQL statements. <i>dsname</i> can include a member name.
LINECOUNT	<i>integer</i>	Specifies how many lines, including headings, are to be printed on each page of printed output. The default is 60.
LINK	<u>YES</u> NO	Specifies whether to execute the linkage editor after successful completion of compilation or assembly. YES indicates that the linkage editor is to be executed. The DSNHLI entry point from the precompiler is directed to the appropriate language interface module that is specified by the RUN parameter. NO indicates that linkage editor processing is to be bypassed.
LLIB L _n LIB	<u>NONE</u> <i>dsname</i>	Specifies a data set that contains object or load modules that are to be included by the linkage editor. The parameters L <i>n</i> LIB (where <i>n</i> can be 2, 3, or 4) are extensions of LLIB, which is used to simplify passing a list of data set names. The LLIB and L _n LIB libraries are concatenated with the XLIB library and the linkage editor include libraries for the specific host language. Object and load module libraries must not be mixed in this concatenation. Use the default , NONE, to specify no data set.

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
LOAD	<i>dsname</i>	Specifies a data set that is to contain the output from the linkage editor (the load module). <i>dsname</i> can include a member name. The default is RUNLIB.LOAD.
LOPTION	<u>NONE</u> <i>string</i>	Specifies a list of linkage editor options. For information about the options you can use, see the appropriate z/OS publication. Use the default , NONE, to give no options.
MACRO	<u>YES</u> NO	Specifies whether the macro preprocessor is to be executed before the precompilation of a PL/I program. If the PL/I macro processor is used, the PL/I *PROCESS statement must not be used to pass options to the PL/I compiler. The COPTION parameter of the DSNH command can be used to pass the needed options to the PL/I compiler.
NEWFUN	V8 V9 V10 V11 V12	Specifies whether to allow syntax for functions that are introduced by a new version of Db2. NEWFUN(NO) and NEWFUN(YES) are deprecated.
NOFOR	<u>NO</u> YES	Specifies whether all FOR UPDATE OF clauses in static SQL statements are optional. When you specify NOFOR(YES), the FOR UPDATE OF clause is optional. Positioned updates can be made to any columns that the user has authority to update. When you specify NOFOR(NO), any query that appears in a DECLARE CURSOR statement must contain a FOR UPDATE OF clause if the cursor is used for positional updates. The clause must designate all the columns that the cursor can update. The option is implied when the STDSQL(YES) option is in effect.
OPTIONS	<u>NO</u> YES	Specifies whether to print the options that are used when executing the precompiler or the CICS command translator with the output listing.
OUTNAME	<u>TEMP</u> <i>string</i>	Specifies the prefix that is used to form intermediate data set names. <i>string</i> must not be enclosed between apostrophes and must not have the same initial character as the <i>dsname</i> for INPUT. It cannot contain special characters.
PARMS	<u>NONE</u> <i>string</i>	Specifies a parameter string that is to be passed to the compiled program during its execution. This parameter is valid only if the run time execution environment requested is TSO. If CAF is specified as the run time execution environment, this parameter is ignored. Use the default , NONE, to pass no parameter string.

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
PASS	ONE or 1 TWO or 2	Specifies how many passes the precompiler is to use. One pass saves processing time, but requires that declarations of host variables in the program precede any reference to those variables. PASS has no effect for COBOL or Fortran; ONE is forced. The default is ONE or 1 for PL/I and C. The default is TWO or 2 for assembler.
PCLOAD	<i>dsname</i>	Specifies the precompiler load module. <i>dsname</i> can include a member name. The default is '(DSNHPC)'.
PLAN	<i>plan-name</i>	Specifies the application plan that is created by the bind process. The default plan name is the first of the following available choices defined in the INPUT data set: <ul style="list-style-type: none"> • DBRM member name • Leftmost qualifier <i>plan-name</i> must not be DEFAULT. If no name is found, a plan is not created.
PLIB PnLIB	<u>NONE</u> <i>dsname</i>	Specifies the data set that contains host language source or SQL statements included by the SQL INCLUDE statement during precompilation. The parameters PnLIB (where <i>n</i> can be 2, 3, or 4) are extensions of PLIB, which is used to simplify passing a list of data set names. Use NONE to specify no data set.
PLI2LIB	<i>dsname</i>	Specifies the linkage editor common library that is used for PL/I routines. This parameter is obsolete.
PLILIB	<i>dsname</i>	Specifies the linkage editor base library that is used for PL/I routines. The default is 'CEE.SCEELKED'.
PLILOAD	<i>dsname</i>	Specifies a data set that contains the PL/I compiler load module. <i>dsname</i> can include a member name. The default is 'IBM.SIBMZCMP(IBMZPLI)'.
PLIPLNK	<i>dsname</i>	Specifies the data set that contains the IBM Environment prelink editor utility invocation load module that is to be used for preparing PL/I programs. <i>dsname</i> can include a member name. The default is 'CEE.SCEERUN(EDCPRLK)'.
PLIPMSG	<i>dsname</i>	Specifies the data set that contains the message library that is to be used by the IBM prelink editor for preparing PL/I programs. <i>dsname</i> can include a member name. The default is 'CEE.SCEEMSGP(EDCPMSG)'.

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
POPTION	<u>NONE</u> <i>string</i>	Specifies a list of the C compiler language prelink utility options Use the default , NONE, to give no options.
PRECOMP	<u>YES</u> NO	Specifies whether to precompile.
PRELINK	<u>YES</u> NO	<p>Specifies whether to execute the C compiler prelink utility to make your program reentrant. This utility concatenates compile-time initialization information (for writable static) from one or more text decks into a single initialization unit. If this step is requested, it must follow the compiler step and precede the link-edit step.</p> <p>This parameter can apply to IBMCOB that also has a prelink step. Whether the prelink step applies to C or IBMCOB is determined by the choice of values C, CPP, or IBMCOB for the HOST parameter.</p> <p>Descriptions of the prelink process for C and IBMCOB are presented in their respective language publications.</p> <p>If PRELINK(YES) is specified or defaulted for a HOST language compiler that does not support the prelink utility, Db2 will issue warning message DSNH760I and prelink utility processing will be bypassed.</p>
PRINT	<u>NONE</u> <i>dsname</i> LEAVE TERM	<p>Specifies where to send printed output, including the lists of options, source, cross-reference, error, and summary information.</p> <p>The default, NONE, omits printed output.</p> <p><i>dsname</i> specifies a data set that is to be used for the output. Do not enclose <i>dsname</i> between apostrophes. The current user profile is prefixed to <i>dsname</i>. The following suffixes are also added:</p> <ul style="list-style-type: none"> • SYSCPRT.LIST for PL/I macro listings (these listings are overwritten by the compiler listings) • PCLIST for precompiler listings • CXLIST for CICS command translator listings • LIST for compiler listings <p>The PRINT parameter is ignored for the compiler step when HOST(CPP) is specified.</p> <ul style="list-style-type: none"> • SYSOUT.PRELLIST for C prelink utility listings • LINKLIST for link-edit listings <p>LEAVE sends output to the specified print data set. You can allocate the print data set in one of the following ways:</p> <ul style="list-style-type: none"> • Dynamically • In the JCL that is used to run the DSNH CLIST (if in batch mode) • With the TSO ALLOCATE command (before running DSNH) <p>TERM sends output to the terminal.</p>
PSECSPAC	<i>integer</i>	<p>Specifies the amount of secondary space to allocate for print data sets, in the units given by SPACEUN.</p> <p>The default is 20.</p>

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
PSPACE	<i>integer</i>	Specifies the primary size of the print data sets in the units given by SPACEUN. The default is 20.
RCTERM	<i>integer</i>	Specifies the minimum value of the return code from the precompile step that prevents execution of later steps. The default is 8.
RUN	TSO or YES BATCH or NO CAF CICS IMS RRSAF	Specifies whether to execute the compiled program if the previous steps are successful, and, if so, in which environment it executes. Your choice for the RUN parameter might affect your choice for LLIB. TSO or YES indicates that the application program is to be scheduled for execution in the TSO environment, and executes the compiled program. BATCH or NO indicates that the application program is not to be scheduled for execution, and defaults to TSO as the execution environment. CAF indicates that the application program is to be scheduled for execution in the call attachment facility environment. Specify BATCH or NO with CAF to indicate that the application program is not to be scheduled for execution, but to identify CAF as the execution environment. (BATCH,CAF) or (NO,CAF) CICS indicates that the application program is not to be scheduled for execution, and identifies CICS as the run time execution environment. CICS applications cannot run in TSO. IMS indicates that the application program is not to be scheduled for execution, and identifies IMS as the run time execution environment. IMS applications cannot run in TSO. RRSAF indicates that the application program is not to be scheduled for execution, and identifies RRSAF as the run time execution environment. RRSAF applications cannot run in TSO.
RUNIN	<u>TERM</u> <i>dsname</i> LEAVE NONE	Specifies where to get input for the RUN step. The default , TERM, gets input from the terminal. <i>dsname</i> specifies a data set that is to be used for the input. LEAVE gets input from SYSIN if the only steps taken are LINK and RUN. LEAVE gets input from FT05F001 if the language is Fortran. Do not use LEAVE in any other case. NONE allocates no input file.
RUNOUT	<u>TERM</u> <i>dsname</i> LEAVE NONE	Specifies where to send output from the RUN step. The default , TERM, sends output to the terminal. <i>dsname</i> specifies a data set to receive output. LEAVE sends output to SYSPRINT if the only steps taken are LINK and RUN. LEAVE sends output to FT06F001 if the language is Fortran. Do not use LEAVE in any other case. NONE allocates no output file for the RUN step.

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
SOMDLLI	<i>dsname</i>	Specifies the name that of the SOM/MVS DLL import library. This parameter is obsolete.
SOURCE	<u>NO</u> YES	Specifies whether the source code and diagnostics are to be printed with output from the precompiler, CICS command translator, and compiler.
SPACEUN	<u>TRACK</u> CYLINDER	Specifies the unit of space for PSPACE and WSPACE. TRACK makes the space unit one track. CYLINDER makes the space unit one cylinder.
SQL	<u>DB2</u> ALL	Specifies how to interpret SQL statements and check syntax for use by either Db2 for z/OS or other database management systems. The default , DB2, indicates that SQL statements are to be interpreted and syntax is to be checked for use by Db2 for z/OS. SQL(DB2) is the recommended mode for DRDA access when the server is a Db2 subsystem. ALL indicates that SQL statements are to be interpreted for use by database management systems that are not Db2 for z/OS. SQL syntax checking is deferred until bind time so that the remote location can bind the resulting DBRM. When SQL(ALL) is in effect, the precompiler issues an informational message if SAA reserved words are used as identifiers. SQL(ALL) is the recommended mode if you have written your application to be executed in a environment that is not Db2 for z/OS. The default is SQL(DB2).
SQLDELIM	<u>DEFAULT</u> APOSTSQL QUOTESQL	Specifies the APOSTSQL or QUOTESQL precompiler option, to set the SQL string delimiter and, by implication, the SQL escape character within SQL statements. Whichever character is chosen to be the string delimiter, the other is used for the SQL escape character. This parameter is effective only for COBOL. For PL/I, Fortran, and assembler language programs, the precompiler forces the APOSTSQL option. DEFAULT designates the value that is chosen during installation for the SQL STRING DELIMITER field on the APPLICATION PROGRAMMING DEFAULTS panel. APOSTSQL specifies that the string delimiter is the apostrophe (') and the escape character is the quotation mark ("). QUOTESQL specifies that the string delimiter is the quotation mark (") and the escape character is the apostrophe (').
STDSQL	<u>NO</u> YES or 86	Specify whether to interpret SQL using a subset of ANSI rules. NO specifies that Db2 rules are used. YES or 86 automatically implies that the NOFOR option is used.

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
SUFFIX	<u>YES</u> NO	Specifies whether the TSO standard naming convention must be followed. That convention adds a TSO authorization ID prefix and a host language suffix to the name of the input data set (unless that name is enclosed between apostrophes, or already ends in the appropriate suffix). For example, names become <i>userid.name.COBOL</i> , <i>userid.name.PLI</i> , <i>userid.name.Fortran</i> , or <i>userid.name.ASM</i> .
SYSTEM	<i>subsystem-name</i>	Specifies the Db2 subsystem name as it is known to the z/OS operating system. The default is the installation-defined subsystem name (often DSN).
TERM	<u>TERM</u> <i>dsname</i> LEAVE NONE	Specifies where to send terminal output, including error information, error statements, and summary information. The default , TERM, sends output to the terminal. <i>dsname</i> specifies a data set that is to be used for terminal output. Do not enclose <i>dsname</i> between apostrophes. The following suffixes are added to <i>dsname</i> : <ul style="list-style-type: none">• PCTERM for precompiler output• LIST for compiler output LEAVE sends the output to the current allocation for SYSTERM. NONE omits terminal output.
TIME	ISO JIS USA EUR LOCAL	Specifies the format for time values that are to be returned, overriding the format that is specified as the location default. There is no default because this option overrides the default previously specified.
VERSION	<i>version-id</i> AUTO	Specifies the name of the version ID for the program and associated DBRM during the Db2 precompile step. AUTO specifies that the consistency token is used to generate the version ID. If the consistency token is a timestamp, the timestamp is converted into ISO character format and used as the version identifier. The default is no version ID if specified at precompiler invocation.
WORKUNIT	<i>unit</i>	Specifies the device to use for print and work data sets. <i>unit</i> can be a unit name or a device type. The default in batch mode is any eligible device. The default in any other mode is the UADS unit name for the current TSO user.
WSECSPAC	<i>integer</i>	Specifies the amount of secondary space to allocate for work data sets, in the units given by SPACEUN. The default is 20.

Table 16. General DSNH CLIST parameters (continued)

Parameter	Value	Comments
WSPACE	<i>integer</i>	Specifies the primary size of the work data sets in the units given by SPACEUN. The default is 20.
XLIB	<i>dsname</i>	Specifies the linkage editor include library that is to be used for Db2 routines. The default is "'prefix.SDSNLOAD'".
XREF	<u>NO</u> YES	Specifies whether a sorted cross-reference listing of symbolic names that are used in source statements is to be printed with output from the precompiler.

Note: Precompiler options do not affect ODBC behavior.

DSNH/DSN subcommand summary

Table 17 on page 318 and Table 18 on page 321 differentiate the functions that support BIND PLAN and BIND PACKAGE. Each table associates the DSNH CLIST parameter and its corresponding DSN BIND PLAN or BIND PACKAGE subcommand keyword, if any. In general:

- The function and value of a CLIST parameter is identical to that of its corresponding DSN subcommand keyword unless otherwise noted.
- A DSNH parameter value of NONE indicates that the corresponding DSN keyword is not specified on subcommand invocation. Exceptions are noted where applicable.

DSNH CLIST/BIND PLAN subcommand comparison

Table 17. DSNH CLIST/ BIND PLAN subcommand summary

DSNH CLIST		BIND PLAN subcommand		Comments
Parameter	Value	Keyword	Value

Usage notes

CICS translator: Do not use CICS translator options in the source language for assembler programs; pass the options to the translator with the CICSOPT option.

COBOL options: The COBOL DYNAM option has several restrictions:

- You cannot use the option with CICS.
- You must use the VS COBOL II library or the Language Environment (z/OS Language Environment) library.
- To use the option with TSO or batch, the SDSNLOAD library must precede the IMS RESLIB in the step library, job library, or link list concatenations.
- To use the option with IMS, the IMS RESLIB must precede DSNLOAD.

Several COBOL options require DD statements that are not provided by the DSNH CLIST, as shown in the following table.

Table 19. COBOL options that require additional DD statements

Option	Statements required for...
CDECK	SYSPUNCH
COUNT	SYSCOUNT, SYSDBG, SYSDBOUT, SYSUT5, a debug file
DECK	SYSPUNCH
DUMP	SYSABEND, SYSDUMP, or SYSUDUMP
FDECK	SYSPUNCH
FLOW	SYSCOUNT, SYSDBG, SYSDBOUT, SYSUT5, a debug file
LVL	SYSUT6
STATE	SYSCOUNT, SYSDBG, SYSDBOUT, SYSUT5, a debug file
SYMDUMP	SYSCOUNT, SYSDBG, SYSDBOUT, SYSUT5, a debug file
SYST	SYSOUT
SYSx	SYSOUx
TEST	SYSUT5

COBOL parameters: The BUF and SIZE parameters passed to the COBOL compiler might need to be changed.

COPTION: Do not use the COPTION parameter to specify values for the LINECOUNT, SOURCE, TERM, and XREF compiler options; use the DSNH LINECOUNT, SOURCE, TERM, and XREF keywords.

Fortran and PL/I considerations: Variable-format input records are not supported.

Library limits: At most, eight bind libraries, four precompile libraries, four compile libraries, and four link-edit libraries can exist.

User-supplied application defaults module (dsnhdec): The following steps are required to enable DSNH CLIST to load your user-supplied *dsnhdec* module rather than the Db2-supplied *dsnhdec* module:

1. The JOBLIB or STEPLIB concatenation of any job or TSO userid that calls DSNH must allocate the library where the user-supplied *dsnhdec* module resides (usually *prefix.SDSNEXIT*) before it allocates the library where the Db2-supplied *dsnhdec* module resides (*prefix.SDSNLOAD*).
2. The DSNH call should include the PCLOAD parameter, coded as follows:

```
PCLOAD( '*'(DSNHPC) )
```

Link-edit:

- DSNH cannot process programs that need additional link-edit control statements and cannot link-edit programs that use the call attachment facility.
- You cannot use the NOLOAD and SYNTAX link-edit options.

NONE is a reserved word: NONE cannot be the name of an input or a load library, or the value of the string passed with PARMS.

SQL host variables: You must explicitly define SQL host variables.

SYSPROC: If compilation is done, the SYSPROC data set must include the Db2 CLIST library.

WORKUNIT parameter: You must use the WORKUNIT parameter when running the DSNH CLIST in batch mode. This ensures that the temporary and intermediate data sets are allocated to the correct devices.

Examples**Example: Using DSNH to prepare and execute a COBOL application**

The following command precompiles, binds, compiles, link-edits, and runs the COBOL program in data set *prefix.SDSNSAMP*(DSN8BC4).

- The compiler load module is in SYS1.LINKLIB (IKFCBL00).
- Additional load modules to be included are in *prefix.RUNLIB.LOAD* and *prefix.SDSNSAMP*.
- The load module is to be put into the data set *prefix.RUNLIB.LOAD*(DSN8BC4).
- The plan name is DSN8BC81 for the bind and run.
- DCLGEN data from *prefix.SRCLIB.DATA* is required for the precompile.
- The DSNH CLIST is in your SYSPROC concatenation.

```
DSNH INPUT('
prefix
.SDSNSAMP(DSN8BC4)') -
  COBLOAD('SYS1.LINKLIB(IKFCBL00)') -
  LLIB('
prefix
.RUNLIB.LOAD') -
  L2LIB('
prefix
.SDSNSAMP') -
  LOAD('
prefix
.RUNLIB.LOAD') -
  PLAN(DSN8BC81) -
  PLIB('
prefix
.SRCLIB.DATA')
```

Example: Using DSNH to prepare and execute a PL/I application

The following command precompiles, binds, compiles, link-edits, and runs the COBOL program in data set *prefix.SDSNSAMP.PLI*(DSN8BP4).

- The program is written in PL/I; the macro pass is not needed.
- The PL/I compiler options MAP and LIST are to be used.
- Additional load modules to be included are in *prefix.RUNLIB.LOAD* and *prefix.SDSNSAMP*.
- The PL/I optimizing compiler load module is in library SYS2.LINKLIB(IELOAA).
- The Db2 subsystem identifier is SSTR.
- The load module is put into the data set *prefix.RUNLIB.LOAD*(DSN8BC4).
- Printed output is sent to the following data sets:

Output	Data set
Precompiler listings	<i>prefix</i> .PROG.PCLIST
Compiler listings	<i>prefix</i> .PROG.LIST
Link-edit listings	<i>prefix</i> .PROG.LIST

- The plan name is DSN8BC81 for the bind and run.
- The DCLGEN data from *prefix*.SRCLIB.DATA is required for the precompile.

```

DSNH INPUT('
prefix
.SDSNSAMP(DSN8BP4)') -
  HOST(PLI) MACRO(NO) -
  COPTION('MAP LIST') -
  LLIB('
prefix
.RUNLIB.LOAD') -
  L2LIB('
prefix
.SDSNSAMP') -
  PLILOAD('SYS2.LINKLIB(IELOAA)') -
  SYSTEM(SSTR) -
  LOAD('
prefix
.RUNLIB.LOAD') -
  PRINT(PROG) -
  PLAN(DSN8BC81) -
  PLIB('
prefix
.SRCLIB.DATA')
```

The COPTION parameters are enclosed between single apostrophes so that they are passed by TSO as a single parameter. If a single token is being passed as a parameter, no apostrophes are needed. That same rule applies to the PARMS and CICSOPT parameters.

If a data set name is being passed as a parameter, and you want TSO to add your user prefix, no apostrophes are needed. If the usual TSO prefixing and suffixing must not be performed, the data set name must be enclosed between sets of three apostrophes if the CLIST is executed implicitly, and sets of six apostrophes if the CLIST is executed explicitly.

The user prefix for that example is *prefix*; if it had been SMITH, the listing data set names would be as shown in the preceding example, except that SMITH would be used as the first level qualifier. For example, the compiler listings would have gone to SMITH.PROG.LIST.

Example: Using DSNH to prepare and execute a COBOL application

The following command precompiles, binds, compiles, link-edits, and runs the COBOL program in data set *prefix*.SDSNSAMP(DSN8BC4).

- The compiler load module is in SYS1.LINKLIB (IKFCBL00).
- Additional load modules to be included are in *prefix*.RUNLIB.LOAD and *prefix*.SDSNSAMP.
- The load module is to be put into the data set *prefix*.RUNLIB.LOAD(DSN8BC4).
- The plan name is DSN8BC81 for the bind and run.
- DCLGEN data from *prefix*.SRCLIB.DATA is required for the precompile.
- The DSNH CLIST is in your SYSPROC concatenation.

```

DSNH INPUT('
prefix
.SDSNSAMP(DSN8BC4)') -
  COBLOAD('SYS1.LINKLIB(IKFCBL00)') -
  LLIB('
prefix
.RUNLIB.LOAD') -
  L2LIB('
prefix
.SDSNSAMP') -
  LOAD('
prefix
```

```
.RUNLIB. LOAD'' ) -
PLAN(DSN8BC81) -
PLIB('
prefix
.SRCLIB. DATA'' )
```

Example: Using DSNH to prepare and execute a C application

The following command precompiles, binds, compiles, link-edits, and runs the C program in data set *prefix.SDSNSAMP*(DSN8BD3).

- The C linkage editor include library is EDC.V1R1M1.SEDCBASE
- The C compiler load module is EDC.V1R1M1.SEDCCOMP(EDCCOMP)
- Printed output is sent to the following data sets:

Output	Data set
Precompiler listings	<i>user-id</i> .TEMP.PCLIST
Compiler listings	<i>user-id</i> .TEMP.LIST
Prelink-edit listings	<i>user-id</i> .TEMP.PRELLIST
Link-edit listings	<i>user-id</i> .TEMP.LINKLIST

- The following C DD names are allocated based on the PRINT keyword value:

DD name	Allocation
SYSCPRT“1” on page 327	Used in the compiler step
SYSUT10“1” on page 327	Used in the compiler step
SYSOUT	Used in the prelink-edit step

Note:

1. SYSUT10 and SYSCPRT are always allocated to the same data set or destination.

- SYSTERM is used in the compiler step. It is based on the TERM keyword.
- CEEDUMP is used in the run step. It is based on the RUNOUT keyword.
- The LOPTION keyword values of AMODE(31) and RMODE(ANY) are required when link editing the C sample program to ensure 31-bit addressability during execution.

```

Related reference

BIND PLAN (DSN)

The DSN subcommand BIND PLAN builds an application plan. All Db2 programs require an application plan to allocate Db2 resources and support SQL requests made at run time.

RUN (DSN)

The DSN subcommand RUN executes an application program, which can contain SQL statements.

BIND PACKAGE (DSN)

The DSN subcommand BIND PACKAGE builds an application package. Db2 records the description of the package in the catalog tables and saves the prepared package in the directory. BIND PACKAGE also deletes phased-out package copies.

DSN (TSO)

The TSO command DSN starts a DSN session.

Related information

About Db2 and related commands

Use the Db2 for z/OS and related commands to execute database administrative functions.

Chapter 41. END (DSN)

The DSN subcommand END is used to end the DSN session and return to TSO.

Environment

This subcommand originates from a TSO input stream when DSN is running in either background or foreground mode.

Data sharing scope: Member

Authorization

None is required.

Syntax

►► END ◄◄

Usage note

Ending the DSN session in batch or foreground: In batch, if END is not found in the SYSIN stream, /* or // ends the DSN session. From the foreground, pressing the ATTENTION key twice ends the DSN session.

Examples

Example: Ending a DSN session

The following example shows how TSO responds when a user ends a DSN session.

```
TSO prompt : READY
USER enters: DSN SYS (SSTR)
DSN prompt : DSN
USER enters: RUN PROGRAM (MYPROG)
DSN prompt : DSN
USER enters: END
TSO prompt : READY
```

Chapter 42. FREE STABILIZED DYNAMIC QUERY (DSN)

The DSN subcommand FREE STABILIZED DYNAMIC QUERY removes from certain catalog tables one or more stabilized dynamic queries. If any of the specified queries are in the dynamic statement cache, FREE STABILIZED DYNAMIC QUERY purges the statements from the dynamic statement cache.

Environment

You can use the FREE STABILIZED DYNAMIC QUERY command from DB2I, or from a DSN session under TSO that runs in either the foreground or background. You can also use the SYSPROC.ADMIN_COMMAND_DSN stored procedure to submit this subcommand from a remote requester.

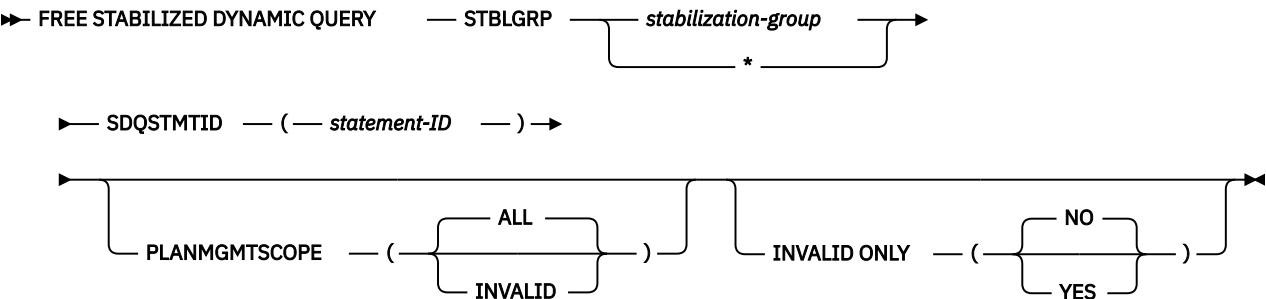

Data sharing scope: Group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SQLADM authority
- System DBADM authority
- SYOPR authority
- SYSCTRL authority
- SYSADM authority

Syntax

Option descriptions

STBLGRP (*stabilization-group*)

Free all stabilized dynamic queries, or for a specific stabilization group.

stabilization-group

Free all stabilized queries for a stabilization group.

*

Free all stabilized queries.

DSQSTMTID (*statement-identifier*)

Free an individual stabilized dynamic query with the specified big-integer constant *statement-identifier* value.

PLANMGMTSCOPE

Which copy of a stabilized dynamic query to free.

ALL

Free all the qualified copies of the stabilized dynamic query. This is the default.

INVALID

Free only the invalid copy (COPYID=4) of the stabilized dynamic query.

INVALIDONLY

Whether to free only copies of the stabilized dynamic query that are invalid.

NO

Free all the qualified copies of the stabilized dynamic query. This is the default.

YES

Free only the copies of the stabilized dynamic queries that are invalid (VALID='N').

Usage notes

If you use FREE DYNAMIC QUERY to free multiple copies, each successful free operation is committed before the next dynamic query is freed. If an error occurs during processing for a dynamic SQL statement, command processing ends for that stabilized dynamic query and continues processing the next stabilized dynamic query.

Examples**Free all stabilized dynamic queries for stabilization group APP01**

```
FREE STABILIZED DYNAMIC QUERY STBLGRP(APP01)
```

Free stabilized dynamic query with statement identifier 1234

```
FREE STABILIZED DYNAMIC QUERY SDQSTMTID (1234)
```

Free the invalid copy (COPYID=4) of the stabilized dynamic query with statement identifier 1234

```
FREE STABILIZED DYNAMIC QUERY SDQSTMTID (1234) PLANMGMTSCOPE(INVALID)
```

Free all copies of the stabilized dynamic query with statement identifier 1234 that are invalid (VALID='N')

```
FREE STABILIZED DYNAMIC QUERY SDQSTMTID (1234) INVALIDONLY(YES)
```

Related tasks

[Stabilizing access paths for dynamic SQL statements \(Db2 Performance\)](#)

Related reference

[-START DYNQUERYCAPTURE \(Db2\)](#)

The Db2 command START DYNQUERYCAPTURE stabilizes access paths for qualified cached dynamic queries. This command can also optionally start monitoring of cached dynamic queries that qualify for a scope but have not met the specified execution threshold for stabilization.

[-DISPLAY DYNQUERYCAPTURE \(Db2\)](#)

The Db2 command DISPLAY DYNQUERYCAPTURE displays all currently active dynamic query capture monitors.

[SYSDYNQRY catalog table \(Db2 SQL\)](#)

Chapter 43. FREE PACKAGE (DSN)

The DSN subcommand FREE PACKAGE can be used to delete a specific version of a package, all versions of a package, or whole collections of packages.

The FREE PACKAGE subcommand deletes corresponding table entries from the catalog tables. Authorization for a package name is removed only when no more versions of the package exist. After a version of a package has been freed, that package name is then available for use in a BIND PACKAGE subcommand to create a new package.

For active package copies, the FREE PACKAGE subcommand does not proceed until all currently running applications that use the package finish running. However, if you specify INACTIVE, PREVIOUS, or ORIGINAL for the PLANMGMTSCOPE option, the FREE PACKAGE subcommand can free the inactive package copies while the applications are running.

The FREE PACKAGE subcommand also deletes phased-out package copies.

Environment

You can enter this subcommand from DB2I, or from a DSN session under TSO that is running in either foreground or background.

Data sharing scope: Group

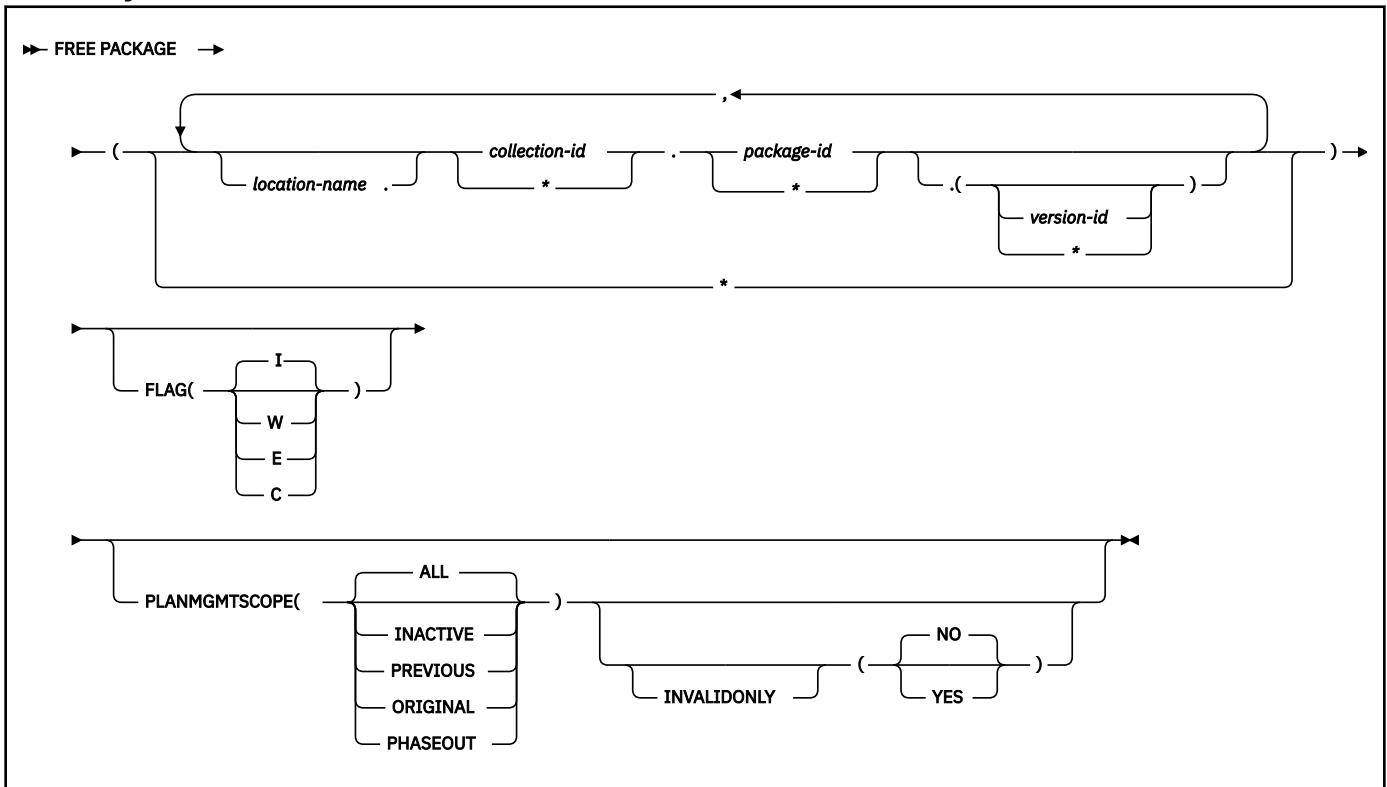

Authorization

To execute this subcommand, you must use a privilege set of the process that includes one of the following privileges or authorities:

- Ownership of the package
- BINDAGENT privilege granted by the owner of the package
- System DBADM authority
- SYSCTRL authority
- SYSADM authority
- PACKADM authority for the collection or for all collections

The BIND privilege on a package is not sufficient to allow a user to free a package.

Syntax

Option descriptions

location-name

Specifies the location of the DBMS where the package is to be freed. The location name must be defined in the SYSIBM.LOCATIONS table. If this table does not exist or the DBMS is not found, you receive an error message. If the location name is specified, the name of the local Db2 subsystem must be defined.

The default is the local Db2 subsystem if you omit *location-name*.

collection-id or (*)

Identifies the collection of the package to be freed. There is no default.

You can use an asterisk (***) to free all local packages with the specified *package-id* in all the collections that you are authorized to free. (You cannot use the *** to free remote packages.)

collection-id can be an un delimited or a delimited identifier. The delimiter for *collection-id* is double quotation marks ("). If *collection-id* is delimited, Db2 does not convert the value to uppercase.

package-id or (*)

Identifies the package to be freed. There is no default.

You can use an asterisk (***) to free all local packages in the *collection-id* that you are authorized to free. (You cannot use the *** to free remote packages.)

package-id can be an un delimited or a delimited identifier. The delimiter for *package-id* is double quotation marks ("). If *package-id* is delimited, Db2 does not convert the value to uppercase.

version-id or (*)

Identifies the version of the package to be freed.

You can use an asterisk (***) to free all local packages in the *collection-id* and *package-id* that you are authorized to free. (You cannot use the *** to free remote packages.)

If you specify () for *version-id*, the empty string is used for the version ID.

If you omit the *version-id* , the default depends on how you specify *package-id* . If you use * for *package-id* , *version-id* defaults to *. If you provide an explicit value for *package-id* , *version-id* defaults to an empty string.

(*)

Frees all local Db2 packages that you are authorized to free.

Specifying (*) is equivalent to specifying the package name as (*.(*)) or (*.*).

FLAG

Indicates what messages you want the system to display. Use one of the following values to show messages of the corresponding types.

(I)

All: informational, warning, error, and completion messages.

(W)

Only warning, error, and completion messages.

(E)

Only error and completion messages.

(C)

Only completion messages.

PLANMGMTSCOPE

Allows you to manually free inactive copies of packages. Use one of the following options to help reclaim disk space:

ALL

Frees the entire package, including copies. This is the default. This option is not supported for trigger packages or SQL routines.

INACTIVE

Frees only previous, original, or eligible phased-out copies from the directory, catalog, and access path repository. FREE PACKAGE with PLANMGMTSCOPE(INACTIVE) succeeds even if the package has no inactive copies. Inactive package copies can be freed while applications that use the package are running. The phased-out copies can also be freed regardless of the INVALIDONLY option.

ORIGINAL

Frees original package copies from the directory, catalog, and access path repository. FREE PACKAGE with PLANMGMTSCOPE(ORIGINAL) succeeds even if the package has no original package copies. Original package copies can be freed while applications that use the package are running.

PREVIOUS

Frees previous package copies from the directory, catalog, and access path repository. FREE PACKAGE with PLANMGMTSCOPE(PREVIOUS) succeeds even if the package has no previous package copies. Previous package copies can be freed while applications that use the package are running.

PHASEOUT

Frees eligible phased-out copies from the directory, catalog, and access path repository. FREE PACKAGE with PLANMGMTSCOPE(PHASEOUT) succeeds even if the package has no phased-out copies. Phased-out package copies can be freed while applications that use the package are running. They can also be freed regardless of the INVALIDONLY option.

INVALIDONLY

Free invalid inactive package copies. Invalid package copies cannot be executed by Db2 without until they are rebound. Specify INVALIDONLY to remove inactive invalid package copies to reclaim space. This action also enables the original package copy to be repopulated on the next REBIND with PLANMGMT(EXTENDED).

NO

Package copies are freed regardless of whether they are valid. NO is the default value.

YES

Only inactive invalid package copies are freed. An inactive package is invalid if the VALID column of SYSIBM.SYSPACKCOPY table row for the package contains a NO value or the current release does not support packages that were bound under the release in which the package copy was bound.

Usage notes

Freeing multiple packages

If you free multiple packages with this subcommand, each successful free is committed before freeing the next package.

If an error occurs on a certain package specified explicitly in a list or implicitly with (*), FREE PACKAGE terminates for that package and continues with the next package to be processed.

Freeing trigger packages

You can free package copies for triggers and SQL routines. However, PLANMGMTSCOPE(ALL) is not supported for trigger packages and SQL routines. You must issue a DROP statement for the trigger or SQL routine to free the active package copies.

Examples

Free version *newver* of the package TEST.DSN8BC81 located at USIBMSTODB22. Generate only warning, error, and completion messages (not informational messages):

```
FREE PACKAGE (USIBMSTODB22.TEST.DSN8BC81.(  
  newver  
)) FLAG(W)
```

Free all packages at the local server in the collection named TESTCOLLECTION.

```
FREE PACKAGE (TESTCOLLECTION.*)
```

Free all inactive package copies for version *newver* of the package &collid.&name located at &location:

```
FREE PACKAGE (&location.&collid.&name.(newver)) PLANMGMTSCOPE(INACTIVE)
```

Free all ORIGINAL package copies:

```
FREE PACKAGE (*. *.*. (*)) PLANMGMTSCOPE(ORIGINAL)
```

Free all inactive invalid package copies.

```
FREE PACKAGE (*. *.*. (*)) PLANMGMTSCOPE(INACTIVE) INVALIDONLY(YES)
```

Related concepts

[Package copies for plan management \(Db2 Performance\)](#)

Chapter 44. FREE PLAN (DSN)

The DSN subcommand FREE PLAN deletes application plans from Db2.

The FREE PLAN subcommand deletes corresponding table entries from the SYSIBM.SYSPLAN catalog tables. All authorization against an application plan name is dropped. The application plan name is then available for use in a BIND PLAN subcommand to create a new package.

The FREE PLAN subcommand does not proceed until all currently executing applications using that plan finish executing.

Environment

You can enter this subcommand from DB2I, or from a DSN session under TSO that is running in either foreground or background.

Data sharing scope: Group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- Ownership of the plan
- BIND privilege on the plan
- BINDAGENT privilege granted by the plan owner
- System DBADM authority
- SYSCTRL authority
- SYSADM authority

Syntax

Option descriptions

(*plan-name* , ...)

Lists the names of one or more plans you want to free.

(***)

Frees *all* application plans over which you have BIND authority. Be careful when using this form of the command.

FLAG

Indicates what messages you want the system to display. Use one of the values listed to show messages of the corresponding types.

(*I*)

All: informational, warning, error, and completion messages.

(W)

Only warning, error, and completion messages.

(E)

Only error and completion messages.

(C)

Only completion messages.

Usage notes

Freeing multiple plans: If you free multiple plans with this subcommand, each successful free is committed before freeing the next plan.

If an error occurs on a certain plan specified explicitly in a list or implicitly with (*), FREE PLAN terminates for that plan and continues with the next plan to be processed.

Example

Free plan DSN8BC81 from Db2. Generate only warning, error, and completion messages (not informational messages).

```
FREE PLAN (DSN8BC81) FLAG (W)
```

Chapter 45. FREE QUERY (DSN)

The DSN subcommand FREE QUERY removes from certain catalog tables for one or more queries. If any of the specified queries are in the dynamic statement cache, FREE QUERY purges them from the dynamic statement cache.

Environment

You can use FREE QUERY from DB2I, or from a DSN session under TSO that runs in either the foreground or background. You can also use the SYSPROC.ADMIN_COMMAND_DSN stored procedure to submit this subcommand from a remote requester.

Data sharing scope: Group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Syntax

➤ FREE QUERY — *filter-block* — *package-block* ➤

filter-block:

package-block:

Option descriptions

FILTER(' *filter-name* ')

Specifies the queries that are to be removed from the access path repository. *filter-name* is a value in the USERFILTER column of the SYSIBM.SYSQUERY catalog table. During FREE QUERY processing, all the rows in the SYSIBM.SYSQUERY table that have the USERFILTER value *filter-name* are removed. Deletions from the SYSIBM.SYSQUERY table are cascaded to the SYSIBM.SYSQUERYPLAN table or the SYSIBM.SYSQUERYOPTS table.

PACKAGE (*package-name*)

The name of the package from which the queries are to be freed.

QUERYID (*number*)

Frees an entry in the SYSIBM.SYSQUERY table that has the same QUERYID value, and the corresponding entries in the SYSIBM.SYSQUERYPLAN table or the SYSIBM.SYSQUERYOPTS table.

QUERYID (ALL)

Frees all the entries from the SYSIBM.SYSQUERY table and the corresponding entries from the SYSIBM.SYSQUERYPLAN table or the SYSIBM.SYSQUERYOPTS table.

location-name

Specifies the location of the data server where the query is to be freed. Only the location name of the local Db2 subsystem can be specified. If the location name is specified, the name of the local Db2 subsystem must be defined in the SYSIBM.LOCATIONS table. If this table does not exist or the data server is not found, an error message is issued.

The default value is the local Db2 subsystem.

***collection-id* or (*)**

Identifies the collection that is associated with the query to be freed. There is no default.

You can use an asterisk (*) to free all packages with the specified *package-id* in all the collections that you are authorized to free.

***package-id* or (*)**

Identifies the package that is associated with the query to be freed. There is no default.

You can use an asterisk (*) to free all packages in the *collection-id* that you are authorized to free.

***version-id* or (*)**

Identifies the version of the package for which the associated query is to be freed.

You can use an asterisk (*) to free all local packages in the *collection-id* and *package-id* that you are authorized to free. You cannot use the * to free remote packages.

If you specify () for *version-id* , the empty string is used for the version ID.

If you omit *version-id* , the default depends on how you specify *package-id* . If you use * for *package-id* , *version-id* defaults to *. If you provide an explicit value for *package-id* , *version-id* defaults to an empty string.

(*)

Frees all local Db2 packages that you are authorized to free.

Specifying (*) is equivalent to specifying the package name as (*.*) or (*.*).

Usage notes

Freeing multiple queries: If you use FREE QUERY to free multiple queries, each successful free operation is committed before the next query is freed. If an error occurs on a query, FREE QUERY terminates for that package and continues processing the next query.

Examples

Example 1: Free all access paths for all queries:

```
FREE QUERY QUERYID(ALL)
```

Example 2: Free queries for which the USERFILTER column of the SYSIBM.SYSQUERY catalog table contains SALESAPP:

```
FREE QUERY  
  FILTER('SALESAPP')
```

Example 3: Free all queries in package SALESPACK:

```
FREE QUERY  
  PACKAGE(SALESCOLL.SALESPACK)
```

Chapter 46. FREE SERVICE (DSN)

The FREE SERVICE (DSN) subcommand deletes an application package that represents a Db2 REST service. The command also removes the corresponding entry from the catalog tables.

The FREE SERVICE subcommand does not proceed until all currently running applications using the package finish running.

Environment

You can issue FREE SERVICE from a DSN session under TSO that runs in the foreground or background.

Data sharing scope: Group

Authorization

To execute this subcommand, you must use a privilege set of the process that includes one of the following privileges or authorities:

- Ownership of the package
- BINDAGENT privilege granted by the package owner
- System DBADM authority
- SYSCTRL authority
- SYSADM authority
- PACKADM authority on the collection or on all collections.

The BIND privilege on a package alone is not sufficient authorization to free a service package.

Syntax

➤➤ FREE SERVICE ➡

➤ (location-name . *collection-id* . *service-name* . (version-id)) ➤

Option descriptions

location-name

Specifies the location of the DBMS where the service is to be freed. The location name must be defined in the SYSIBM.LOCATIONS table. If this table does not exist or the DBMS is not found, you receive an error message. If the location name is specified, the name of the local Db2 subsystem must be defined. If you omit *location-name*, the default is the local Db2 subsystem.

collection-id

Identifies the collection of the REST service. There is no default. The *collection-id* can be an undelimited or a delimited identifier. The delimiter for *collection-id* is double quotation marks ("). If *collection-id* is delimited, Db2 does not convert the value to uppercase.

service-name

Identifies the REST service. There is no default. The *service-name* can be an undelimited or a delimited identifier. The delimiter for *service-name* is double quotation marks ("). If *service-name* is delimited, Db2 does not convert the value to uppercase.

version-id

Identifies the version of the REST service.

If you specify () for version-id, or if you omit the version-id , the default version of the REST service is deleted.

Related tasks

[Dropping a Db2 REST service \(Db2 REST services\)](#)

Related reference

[BIND SERVICE \(DSN\)](#)

The BIND SERVICE (DSN) subcommand builds an application package that represents a Db2 REST service. Db2 records the description of the service in the catalog tables and saves the prepared package in the directory.

[BIND and REBIND options for packages, plans, and services](#)

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

Chapter 47. MODIFY admtproc,APPL=SHUTDOWN

The MODIFY *admtproc*, APPL=SHUTDOWN command stops the administrative task scheduler from accepting requests and starting new task executions. It also shuts down the administrative task scheduler.

When the SHUTDOWN option is specified, the administrative task scheduler waits until the execution of all currently running tasks completes. When all running tasks are complete, the administrative task scheduler terminates.

Environment

This command can be issued only from a z/OS console.

Data sharing scope: Member

Authorization

The command requires an appropriate level of operating system authority.

Syntax

➤ MODIFY — *admtproc* ,APPL= — SHUTDOWN ➤

You cannot include spaces when you specify options.

Option descriptions

admtproc

Specifies the procedure name of the scheduled task of the administrative task scheduler that you want to modify.

Examples

Example 1: This command modifies the *admtproc* scheduler in order to shut it down.

Enter the following command on the system console:

```
modify admtproc,appl=SHUTDOWN
```

Chapter 48. MODIFY admtproc,APPL=TRACE

The MODIFY *admtproc*, APPL=TRACE command starts or stops traces in the administrative task scheduler.

It is not required to stop the scheduler to access the trace. If you want to turn trace on or off when the administrative task scheduler starts, you can take one of the following actions:

- Modify the procedure parameter TRACE in the JCL job that starts the administrative task scheduler. This job has the name *admtproc* and was copied into one of the PROCLIB library during the installation. Specify TRACE=ON or TRACE=OFF.
- Dynamically overwrite the trace parameter on the operator's console when starting the administrative task scheduler. This option does not exist when Db2 starts the administrative task scheduler automatically, and can only be done manually.

Environment

This command can be issued only from a z/OS console.

Data sharing scope: Member

Authorization

The command requires an appropriate level of operating system authority.

Syntax

```
➤ MODIFY — admtproc ,APPL= — TRACE= — ON — OFF — ➤
```

You cannot include spaces when you specify options.

Option descriptions

admtproc

Specifies the procedure name of the administrative task scheduler task that you want to modify.

ON

Turns the trace on.

OFF

Turns the trace off.

Examples

Example 1: This command modifies the *admtproc* scheduler and turns the trace on.

Enter the following command on the system console:

```
modify admtproc,appl=trace=on
```

Response from z/OS console:

```
STC00072 DSN A672I MODIFY COMMAND FOR ADMIN SCHEDULER V91AADMT  
NORMAL COMPLETION
```

Example 2: This command modifies the *admtproc* scheduler and turns the trace off.

Enter the following command on the system console:

```
modify admtproc,appl=trace=off
```

Response from z/OS console:

```
STC00072 DSNA672I MODIFY COMMAND FOR ADMIN SCHEDULER V91AADMT  
NORMAL COMPLETION
```

Chapter 49. -MODIFY DDF (Db2)

The MODIFY DDF command modifies information regarding the status and configuration of DDF, as well as statistical information regarding connections or threads controlled by DDF.

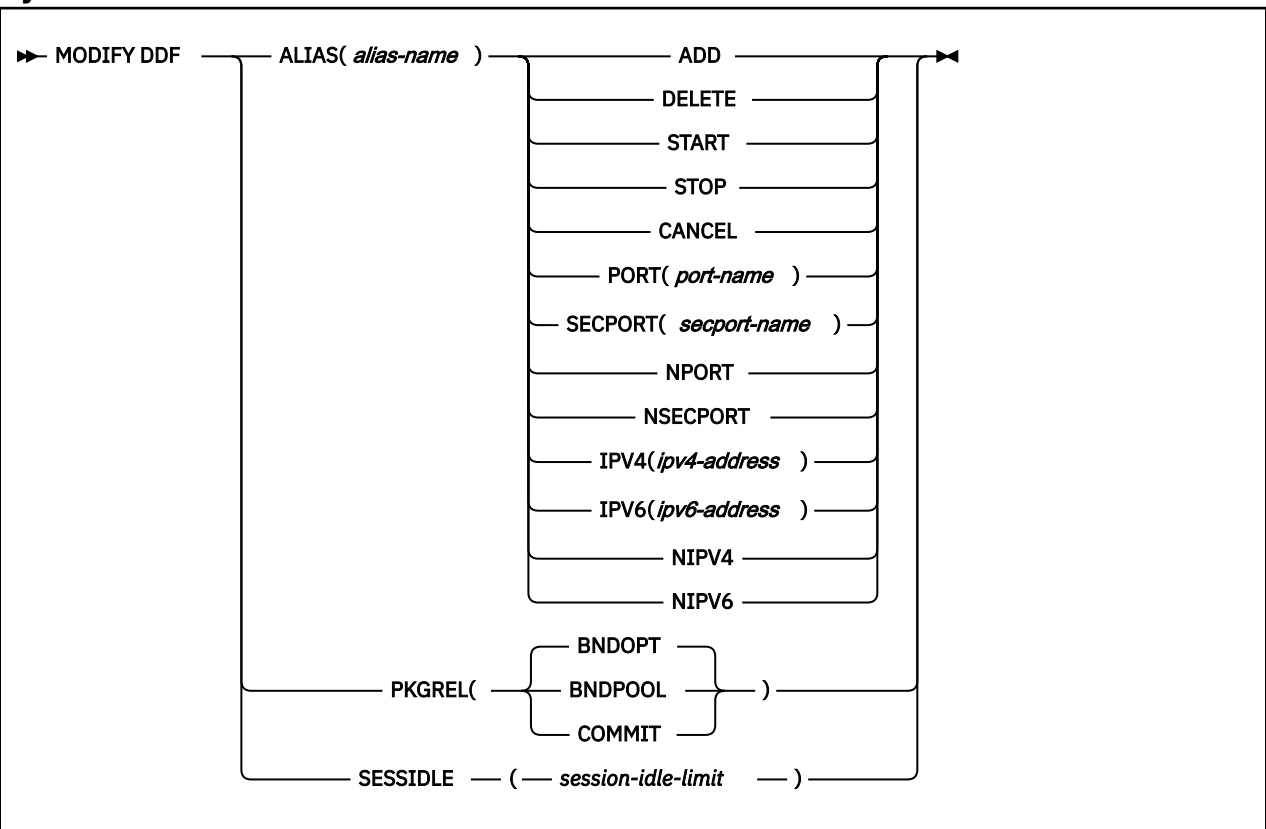

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

ALIAS

Specifies the creation, changes to, or deletion of a specified location alias.

alias-name

Specifies the name of an alias for a DDF location. An alias is an alternative for the location name that can be used for connection processing. The alias name must meet all of the following requirements:

- Contains no more than 16 characters.

- Contains only letters (excluding alphabetic extenders), numbers, or the underscore character.

ADD

Creates a new alias with the specified name.

DELETE

Deletes the specified alias.

START

Db2 starts accepting connection requests to the specified alias if DDF is started. If DDF is not started, the alias is marked eligible for starting, and Db2 automatically starts accepting connection requests to the alias when DDF is started.

If the subsystem is part of a data sharing group, Db2 registers the alias with WLM and Db2 participates in sysplex workload balancing for connections to the alias.

STOP

Db2 stops accepting new connection requests to the specified alias. Existing database access threads that process connections to the alias remain unaffected. Inactive connections related to the alias are closed.

A stopped alias is marked ineligible for starting and does not start automatically when DDF starts. If the subsystem is part of a data sharing group, Db2 de-registers the alias with WLM and Db2 stops participating in sysplex workload balancing for connections to the alias.

CANCEL

Db2 stops accepting new connection requests to the specified alias. All database access threads that process connections to the alias are canceled and inactive connections related to the alias are closed.

A canceled alias is marked ineligible for starting and does not start automatically when DDF starts. If the subsystem is part of a data sharing group, Db2 de-registers the alias with WLM and Db2 stops participating in sysplex workload balancing for connections to the alias.

PORT(*port-name*)

Adds or replaces an existing port that can be used by DDF to accept distributed requests for the specified alias. The value specified for *port-name* value must be a decimal number between 1 and 65535, including 65535, and must be different than the values for the ports of other aliases. Specify a PORT value for an alias when you want to identify a subset of data sharing members to which a distributed request can go.

SECPORT(*secport-name*)

Adds or replaces an existing secure port that can be used by DDF to accept secure distributed requests using SSL for the specified alias. The value specified for *secport-name* must be a decimal number between 1 and 65535, including 65535, and must be different than the values for ports of other aliases. Specify a SECPORT value for an alias when you want to identify a subset of data sharing members to which a secure distributed request can go.

NPORT

Deletes the alias port, if one exists.

NSECPORT

Deletes the alias secure port, if one exists.

IPV4(*IPv4-address*)

Adds or replaces an existing member-specific IPv4 address. Clients use that address when they use one of the following capabilities for a connection to a dynamic location alias:

- Sysplex workload balancing
- XA protocols for coordinating distributed transactions

This address must be specified in the dotted decimal form.

IPV6(*IPv6-address*)

Adds or replaces an existing member-specific IPv6 address. Clients use that address when they use one of the following capabilities for a connection to a dynamic location alias:

- Sysplex workload balancing
- XA protocols for coordinating distributed transactions

This address must be specified in the colon hexadecimal form.

NIPV4

Deletes the alias IPv4 address, if one exists.

NIPV6

Deletes the alias IPv6 address, if one exists.

PKGREL

Specifies whether Db2 honors the bind options of packages that are used for remote client processing.

BNDOPT

The rules of the RELEASE bind option that was specified when the package was bound are applied to any package that is used for remote client processing. The high performance DBAT that is used by a terminating client connection is deallocated. BNDOPT is the default value of the MODIFY DDF PKGREL command.

BNDPOOL

The rules of the RELEASE bind option that was specified when the package was bound are applied to any package that is used for remote client processing. The high performance DBAT that is used by a terminating client connection is pooled.

COMMIT

The rules of the RELEASE(COMMIT) bind option are applied to any package that is used for remote client processing. COMMIT is the default value when the CMTSTAT subsystem parameter is set to ACTIVE. If the MODIFY DDF PKGREL command had never been issued, then COMMIT is the default value and the CMTSTAT subsystem parameter is set to INACTIVE.

SESSIDLE(session-idle-limit)

Specifies that number of minutes that applications can remain inactive before the associated session data token becomes invalid because of timeout.

session-idle-limit can be any integer 0 - 999999. When no value was specified the default value is 1440.

Usage notes

When to use PKGREL options: You can specify that DDF uses the PKGREL(BNDOPT) or PKGREL(BNDPOOL) option during normal production operating hours. For environments where client configurations control the use of packages which were bound with the RELEASE(DEALLOCATE) bind option, BNDOPT may be the preferred value of the PKGREL option. For environments where any client is capable of using packages bound with the RELEASE(DEALLOCATE) bind option, BNDPOOL might be the preferred value of the PKGREL option. Either option value offers improved performance by reducing the CPU costs for allocation and deallocation of packages. However, packages that run under the rules of the RELEASE(DEALLOCATE) bind option are likely to remain allocated and prevent maintenance activities such as objects modifications and bind operations. Consequently, you can use the specify the PKGREL(COMMIT) option during routine and emergency maintenance periods.

Delayed effects of PKGREL(COMMIT): When you issue the MODIFY DDF command and specify the PKGREL(COMMIT) option, the effects are not immediate. After the command is issued, any database access thread that was running RELEASE(DEALLOCATE) packages is terminated when the connection becomes inactive. At the next unit-of-work from the client, a new database access thread is created in RELEASE(COMMIT) mode. Any database access thread that remains active waiting for a new unit-of-work request from its client because of the rules of RELEASE(DEALLOCATE) is terminated by the DDF service task that runs every two minutes. Consequently, within approximately two minutes all database access threads run under the rules of the RELEASE(COMMIT) bind option.

Changes to alias attributes: The attributes of an existing alias can be modified only when the alias is stopped. The modified alias attributes take effect when the alias is started. By default, aliases created

by the DSNJU003 utility are started and those created by the MODIFY DDF command are stopped. DSNJU004 does not print any information for aliases that are created by the MODIFY DDF command. You can use the output of the DISPLAY DDF command to find the status of a aliases created by the MODIFY DDF command.

How Db2 uses the IPV4 and IPV6 values: Db2 does not activate the IP addresses that you specify with the IPV4 or IPV6 parameters. Clients use those addresses for routing purposes only. Db2 does not require that the addresses are dynamic virtual IP addresses (DVIPAs). The IP addresses are used to reach the DVIPA network that serves the Db2 data sharing group. You can specify the IP addresses in the MODIFY DDF command only after the DSNJU003 is run with the IPV4 or IPV6 parameter to specify a member-specific location address. The specified IP addresses are returned in the WLM weighted server list when clients connect to a dynamic location alias, based on the following conditions:

- If the client connects using an IPv6 address, the server list contains the alias IP addresses that were specified with the IPV4 and IPV6 parameters of the MODIFY DDF command. If an IPv4 address was not specified in the MODIFY DDF command, the location IP address that was specified using the IPV4 keyword of the DSNJU003 utility is returned instead. Similarly, if an IPv6 address is not specified in the MODIFY DDF command, the location IP address that was specified using the IPV6 keyword of the DSNJU003 utility is returned instead.
- If the client connects using an IPv4 address, the server list contains the alias IP address that was specified with the IPV4 parameter of the MODIFY DDF command. If an IPv4 address was not specified in the MODIFY DDF command, the location IP address that was specified using the IPV4 keyword of the DSNJU003 utility is returned instead.

Chapter 50. MODIFY irlmproc,ABEND (z/OS IRLM)

The MODIFY *irlmproc* , ABEND command terminates IRLM abnormally. IRLM processes this command even if a Db2 subsystem is identified to it.

Abbreviation: F

Environment

This command can be issued only from a z/OS console.

Data sharing scope: Member

Authorization

The command requires an appropriate level of operating system authority.

Syntax

Option descriptions

Parameters must be separated by commas with no spaces.

irlmproc

Specifies the procedure name of the IRLM that is to be terminated.

DUMP

Specifies that IRLM is to terminate abnormally with a U2020 abend. A system dump is taken to the SYS1.DUMPxx data set. IRLM does not deregister from ARM.

NODUMP

Specifies that IRLM is to FORCE the DBMS off and terminate normally without generating a dump. All DBMS work is quiesced and IRLM stops itself. NODUMP **requires** that IRLM be functioning normally.

Do not use this option if IRLM appears to be hung.

A second invocation causes IRLM to terminate abnormally with a U2020 abend; no dump is taken.

Usage notes

Terminating IRLM: Use the STOP irlmproc (z/OS IRLM) command to terminate IRLM.

Deregistering IRLM: You can use the NODUMP option to deregister IRLM before stopping it. This action prevents the automatic restart manager from immediately trying to restart IRLM.

Example

Enter the following command on the system console:

```
F KRLM001,ABEND
```

Response on the z/OS system console is as follows:

```
DXR124E IR21001 ABENDED VIA MODIFY COMMAND
*IEA911E COMPLETE DUMP ON SYS1.DUMP00
FOR ASID(0004)
```

```
ERROR ID = SEQ00001 CPU00 ASID0004 TIME08.34.59.9
DXR121I IR21001 END-OF-TASK CLEANUP SUCCESSFUL
IEF450I IR21001 IR21001 - ABEND=S000 U2020 REASON=00000000
```

The default is dump. If you do not want a dump, you must specify the following command:

```
F KRLM001,ABEND,NODUMP
```

NONE

Disables generating all diagnostic dumps.

HANG

Collects IRLM SYSPLEX dumps when DEADLOCK or TIMEOUT issues are suspected. The dumps are taken during DEADLOCK processing. The DEADLOCK processing is stopped, and the dynamic deadlock storage is collected. z/OS DUMP services then schedules an SRB to restart DEADLOCK processing. Message DXR183I is issued by each IRLM as DEADLOCK processing is restarted. If message DXR183I is not issued by an IRLM, that IRLM must be terminated and restarted. You must start the IRLM XCF CTRACE internally and wait 30 seconds before issuing this command.

Usage note

The `MODIFY irlmproc,DIAG` command should be used only under the direction of IBM Support.

This command is active for only one incident per IRLM, that is, after an IRLM instance detects the delay and initiates the dump. You can initiate one dump per IRLM in the group. You must enter the command again to initiate another dump. Be aware that when you enter this command for one member of the data sharing group, **any** member that detects the delay initiates a dump.

The *irlmproc* identifies the procedure name for IRLM. If multiple IRLM instances exist in the same system, each procedure must have a unique name.

Example

Issue this command to initiate one diagnostic dump for the IR21PROC IRLM subsystem. The dump occurs once, after the propagation of child locks takes longer than 45 seconds.

```
MODIFY IR21PROC,DIAG,DELAY
```

Chapter 52. MODIFY irlmproc,PURGE (z/OS IRLM)

The MODIFY irlmproc,PURGE command releases IRLM locks retained due to a Db2, IRLM, or system failure.

The command causes all retained locks for the specified Db2 to be deleted from the system, thereby making them available for update. Because retained locks protect updated resources, it should be used only after understanding what the resources are and the consequence to data integrity if they are deleted.

Abbreviation: F

Environment

This command can be issued only from a z/OS console.

Data sharing scope: Member

Authorization

The command requires an appropriate level of operating system authority.

Syntax

```
➤ MODIFY — irlmproc ,PURGE, db2name ➤
```

Option descriptions

Use commas with no spaces to separate parameters.

irlmproc

Specifies the active IRLM that is to process the command.

db2name

Specifies the inactive Db2 name, as displayed by the STATUS command.

Usage notes

Db2 subsystem inactive: The Db2 subsystem that owns the retained locks must be inactive or else this command fails.

The irlmproc must be the procedure name of an active IRLM that is connected to the same sysplex group as the failed member. Issuing a purge request using an inactive IRLM returns error IEE341I.

Example

Example: For an active Db2 subsystem named db2b with irlmproc name db2birlm, issue the following command to display all active and inactive subsystems in a data sharing sysplex:

```
F db2birlm,STATUS,ALLD
```

If the subsystem db2a is inactive, enter the following command:

```
F db2birlm,PURGE,db2a
```

Response on the MVS system console for completed purge request:

```
DXR109I IR2B002 PURGE COMMAND COMPLETED FOR DB2A
```

Explanation: In a sysplex environment, if the Db2 database is inactive and the database IRLM has stopped or is disconnected, the operator of the z/OS system uses one of the other active IRLM members to query retained locks and issue the PURGE request.

Chapter 53. MODIFY irlmproc,SET (z/OS IRLM)

The MODIFY irlmproc,SET command dynamically sets various IRLM operational parameters

The MODIFY irlmproc,SET command performs the following tasks:

- Dynamically sets the maximum private storage allowed from IRLM.
- Dynamically sets the number of trace buffers allowed for IRLM.
- Dynamically sets the number of LOCK LTE entries to be specified on the next connect to the XCF LOCK structure.
- Dynamically sets the timeout value for a specified subsystem.
- Dynamically sets the local deadlock frequency.

Abbreviation: F

Environment

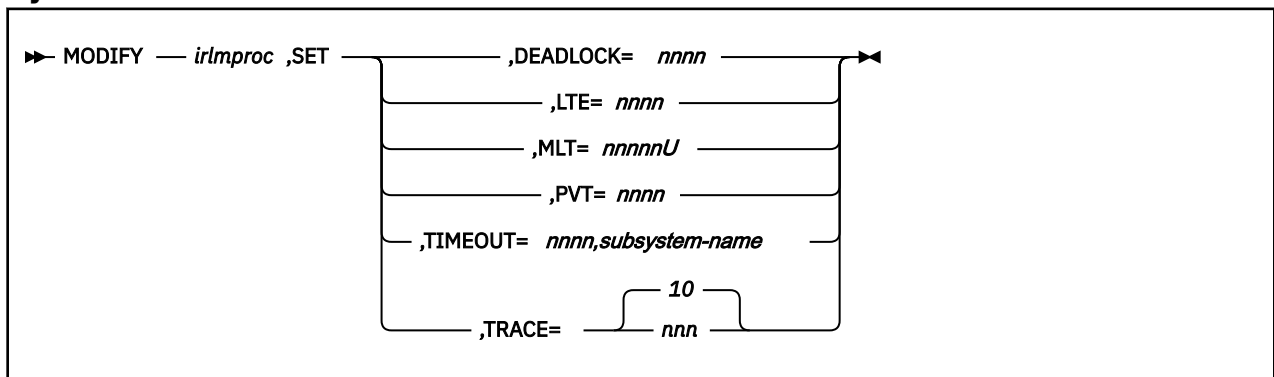

This command can be issued only from a z/OS console.

Data sharing scope: Group or Member, depending on whether you specify the DEADLOCK or LTE options.

Authorization

The command requires an appropriate level of operating system authority.

Syntax

Option description

Use commas with no spaces to separate parameters.

irlmproc

Specifies the IRLM that is to process the command.

SET

Sets the following values for this IRLM:

DEADLOCK= nnnnn

Specifies the number, in milliseconds, indicating how often the local deadlock processing is scheduled. *nnnn* must be a number from 100 through 5000 milliseconds. If a member of a sysplex group and all IRLMs are not enabled for subsecond deadlock processing, message DXR106E is issued.

LTE= nnnnn

Specifies the number of lock table entries that are to be specified on the next connect to the XCF lock structure. *nnnn* must be a number from 0 through 2048, and it must be an

exact power of 2. Each increment in value represents 1 048 576 LTE entries. Note that this parameter is used for data sharing only.

MLT= *nnnnnU*

Specifies the upper limit of private storage above the two gigabyte bar, also called the MEMLIMIT, that is managed by MVS. This command allows you to dynamically change the MEMLIMIT for IRLM. This storage is used for locks and deadlock processing. The value *nnnnn* is a five digit number in the range 1 through 99999, and *U* is a one character unit indicator with the value of M for megabytes, G for gigabytes, T for terabytes, or P for petabytes. The MLT value that is specified for IRLM must be at least 2 GB. The MLT value that is specified for IRLM must be at least 2 GB. The setting of the MEMLIMIT value through the MLT parameter is temporary, holding only as long as the execution of the IRLM instance. To make a permanent MEMLIMIT change, update the MEMLIMIT value in the corresponding IRLM startup procedure.

PVT= *nnnn*

Specifies the upper limit of private storage, below the two gigabyte bar. *nnnn* must be a four digit number from 1 through 1800. You can specify this value in megabytes or gigabytes by specifying M (for megabytes) or G (for gigabytes) after the value, as follows, *nnnn* M or *nnnn* G. IRLM monitors the amount of private storage used for locks. If the specified limit is reached, new lock requests will be rejected unless they are **must complete**. If the specified value is out of range or if IRLM's use of private storage is already larger than the specified value, the command is rejected with message DXR106E. No reserve for must complete locks is calculated from the specified PVT= value.

TIMEOUT= *nnnn,subsystem-name*

Requests that IRLM dynamically set the timeout value, in seconds, for the specified subsystem. *nnnn* must be a number from 1 through 3600. *subsystem-name* is the Db2 subsystem name, as displayed by the MODIFY irlmproc,STATUS command.

TRACE= *nnn*

Requests that IRLM dynamically set the maximum number of 64 KB trace buffers per trace type to the value you specify in *nnn*. *nnn* must be a number from 10 through 255. If you specify a value outside of this range, IRLM automatically adjusts the value to a value within the range.

The **default** is 10.

This value is used only when the external CTRACE writer is not active. The trace buffers are allocated from extended common storage area (ECSA).

IRLM does not immediately acquire the number of trace buffers you set using this command; IRLM allocates buffers as needed, not to exceed the number of buffers you specify. If the number of trace buffers that you set is less than the number of currently allocated buffers, IRLM brings the number within your specified range by releasing the oldest buffers at the end of the next deadlock cycle.

Usage notes

Effect of an IRLM restart: The values you set using the MODIFY irlmproc,SET command do not persist through a stop and restart of IRLM. The number of trace buffers for each trace type returns to the default value of 10.

TIMEOUT considerations: The TIMEOUT value must be a multiple of the local deadlock parameter. If the value entered is not an even multiple of the deadlock parameter, IRLM will increase the timeout value to the next highest multiple. This new value is used until the IRLM or identified subsystem is terminated, or the timeout is changed again by the operator. The value specified on the command does *not* affect the timeout value in the Db2 subsystem parameters.

The LTE value is used in the following order:

1. The value specified using the MODIFY irlmproc,SET,LTE= command, if the value is greater than zero.
2. The value from the LTE= in the IRLMPROC, if the value is greater than zero.

3. The value determined by the existing logic, which divides the XES structure size returned on the XESQUERY call by 2 multiplied by the LTE width. The result is rounded to the nearest power of 2, which the existing logic uses for the value.

Note: The LTE width is determined by the MAXUSRS value.

If an attempt is made to use a nonzero value from either option number 1 or 2, and that value is too large for the structure size that is returned on the QUERY, the value from the next option in the sequence is used instead.

Deadlock value range for non-supporting members: When an IRLM that supports subsecond deadlock joins a group that has a member that does not support subsecond deadlock, if the deadlock value of the new member is less than one second, the value is set to one second.

Examples

Example 1: Enter the following command on a z/OS system console:

```
F IR21PROC,SET,TRACE=20
```

Response on the z/OS system console is as follows:

```
DXR177I IR21033 THE VALUE FOR TRACE IS SET TO 20.
```

Example 2: Enter the following command on a z/OS system console:

```
F IR21PROC,SET,TIMEOUT=60,DBMS
```

Response on the z/OS system console is as follows:

```
DXR177I IR21033 THE VALUE FOR TIMEOUT IS SET TO 60 FOR DBMS
```

Example 3: Enter the following command on a z/OS system console:

```
F IR21PROC,SET,LTE=1024
```

Response on the z/OS system console is as follows:

```
DXR177I IR21033 THE VALUE FOR LTE IS SET TO 1024
```

Example 4: Enter the following command on a z/OS system console:

```
F IR21I,SET,DEADLOCK=1000
```

Response on the z/OS system console is as follows:

```
DXR177I IR21033 THE VALUE FOR DEADLOCK IS SET TO 1000 MILLISECONDS
```

Example 5: Enter the following command on a z/OS console:

```
F IR21I,SET,PVT=1000
```

Response from the z/OS system console is as follows:

```
DXR177I IR21033 THE VALUE FOR PVT IS SET TO 1000
```

Example 6: Enter the following command on a z/OS console:

```
F IR21I,SET,MLT=4G
```

Response from the z/OS system console is as follows:

```
DXR177I IR21033 THE VALUE FOR MLT IS SET TO 4G
```

Chapter 54. MODIFY irlmproc,STATUS (z/OS IRLM)

The MODIFY irlmproc,STATUS command displays information for one or more subsystems connected to the IRLM that is specified using *irlmproc* .

Each subsystem connected to the specified IRLM is listed, including subsystem name, status, work unit, lock information, the current values of the IRLM TIMEOUT, and DEADLOCK parameter values. Additionally, you can list an IRLM's ID and service level. For a specified IRLM, you can display the current storage allocated, as well as the greatest amount of storage that was allocated since the last time this IRLM was started.

Abbreviation: F

Environment

This command can be issued only from a z/OS console.

Data sharing scope: Member or group, depending on which option you choose

Authorization

The command requires an appropriate level of z/OS authority.

Syntax

Option descriptions

irlmproc

Specifies the IRLM that is to process the command.

irlmx

Specifies which IRLM's status is to be displayed. *irlmx* is the concatenation of the IRLM subsystem name and IRLM member ID as specified in the IRLM startup procedure (Db2 installation panel DSNTIPI). An example is DJ2A2 (the member ID is 2).

ALLD

Requests the Db2 subsystem name and status of a Db2 that is identified to an IRLM. In a data sharing group, this command lists information about all Db2 subsystems that are currently identified to an IRLM, assuming that the IRLM on which the command is issued is connected to the data sharing group. You can determine if the IRLM is connected by issuing a MODIFY irlmproc,STATUS command and checking that the output shows SCOPE=GLOBAL.

If a Db2 is down and holds retained locks, that Db2 is also displayed. However, the IRLM that is displayed with that Db2 can vary depending on several circumstances:

- Normally, it is the last IRLM to which the Db2 subsystem identified.

- If a rebuild of the lock structure occurred after the retained locks were created, the IRLM with the lowest member ID at the time the rebuild occurred is displayed.
- If a group restart is occurring and one Db2 subsystem is recovering on behalf of another Db2 subsystem, the IRLM that is displayed is the one associated with the Db2 subsystem doing the peer recovery. For example, if DB1A is doing a peer recovery of DB2A, the display might show the following information:

NAME	STATUS	...	IRLM_NAME
DB1A	UP		IRLA
DB2A	DOWN		IRLA

ALLI

Requests the IRLM subsystem name, ID, status, and service level. In a data sharing group, this command lists information about all IRLM subsystems in the data sharing group, assuming that the IRLM on which the command is issued is connected to the data sharing group. You can determine if the IRLM is connected by issuing a MODIFY irlmproc,STATUS command and checking that the output shows SCOPE=GLOBAL.

In a list of IRLM subsystems in a data sharing group, the name of the IRLM that is the global deadlock manager is followed by an asterisk (*).

If an IRLM is down, it is displayed only if its associated Db2 subsystem is down and holds retained locks. The IRLM that is displayed can vary depending on several circumstances:

- Normally, it is the last IRLM to which the Db2 subsystem identified.
- If a rebuild of the lock structure occurred after the retained locks were created, the IRLM with the lowest member ID at the time the rebuild occurred is displayed.
- If the failed Db2 subsystem had recovery done on its behalf by another Db2 subsystem, the IRLM that is displayed is the one associated with the Db2 subsystem that did the peer recovery.

MAINT

For this IRLM only, displays the maintenance levels of IRLM load module CSECTS in a two-column format.

STOR

For this IRLM only, displays the current and maximum allocation for CSA, ECSA, and private extended storage.

TRACE

Requests information about IRLM subcomponent trace types. Information includes whether a subcomponent trace type is active, how many trace buffers are used by the trace, and whether the component trace external writer is active for the trace.

Output

Output from the command is presented in a DXR message. The command options determine which DXR message is used.

- [#unique_154](#)
- [#unique_155](#)
- [#unique_156](#)
- [#unique_157](#)
- [#unique_158](#)
- [#unique_159](#)

Usage notes

Messages: If *irlmx* is not specified, or if this IRLM is in a non-data-sharing environment, message DXR101I is issued. That message lists each subsystem connected to the IRLM specified by *irlmx*, with an indication as to whether the connection is active.

Displaying IRLM IDs: If *irlmproc* is started specifying SCOPE=GLOBAL, the second line of the display indicates the IRLM IDs of the IRLM subsystems.

Examples

Example 1: Enter the following command on the z/OS system console:

```
MODIFY IRTPROC,STATUS
```

Response on the z/OS system console:

```
DXR101I IR2T001 STATUS SCOPE=LOCAL
DEADLOCK:0500
SUBSYSTEMS IDENTIFIED
NAME      T/OUT  STATUS  UNITS  HELD  WAITING  RET_LKS
DSNT1     0010   UP      0005   0010   0002     0
```

Explanation: The operator on the z/OS system has requested information about the Db2 systems connected to the IRLM identified by the IRLM procedure named IRTPROC.

If the IRLM is SCOPE=GLOBAL on the *irlmproc* and is not connected to any group, the status message shows:

```
DXR101I IR21001 STATUS SCOPE=DISCON DEADLOCK: dddd SUBSYSTEMS IDENTIFIED
NAME      T/OUT  STATUS  UNITS  HELD  WAITING  RET_LKS
ssname zzz  wun   reh   rew   rtkls
```

Use the information in message [#unique_155](#) to interpret the output.

Example 2: Assume that you have a data sharing group. Enter the following command on the system console:

```
MODIFY DB1GIRLM,STATUS,ALLD
```

The response on the system console is as follows:

```
11.11.07 STC00061 DXR102I DJ1G001 STATUS C
SUBSYSTEMS IDENTIFIED
NAME      STATUS  RET_LKS  IRLMID  IRLM_NAME  IRLM_LEVL
DB1G      UP      0        001     DJ1G      2.022
DB2G      UP      0        002     DJ2G      1.022
DXR102I End of display
```

Explanation: The output shows all the Db2 subsystems that are connected to IRLMs in this data sharing group (the group to which the IRLM processing the request belongs).

Use the information in message [#unique_156](#) to interpret the output.

Example 3: To display information about a specific member of a data sharing group, enter the following command:

```
MODIFY DB1GIRLM,STATUS,DJ1G002
```

Response on system console is as follows:

```
11.11.21 STC00061 DXR102I DJ1G001 STATUS C
SUBSYSTEMS IDENTIFIED
NAME      STATUS  RET_LKS  IRLMID  IRLM_NAME  IRLM_LEVL
DB1G      UP      0        002     DJ1G      2.022
DXR102I End of display
```

Explanation: This output shows information similar to the output that is shown in example 1, but this command specifies a specific IRLM in the data sharing group.

Use the information in message [#unique_156](#) to interpret the output.

Example 4: Again, assume data sharing is in effect. Enter the following command on the system console:

```
MODIFY DB1GIRLM,STATUS,ALLI
```

The response on the console is as follows:

```
11.11.00 STC00061 DXR103I DJ1G001 STATUS C
IRLMS PARTICIPATING IN DATA SHARING GROUP FUNCTION LEVEL=1.022
IRLM_NAME IRLMID STATUS LEVEL SERVICE MIN_LEVEL MIN_SERVICE
DJ1G      001    UP   2.022 HIR2220    2.022    HIR2220
DJ2G      002    UP   1.022 PQ52360    1.012    PN90337
DXR103I End of display
```

Explanation: The output shows the IRLMs that are participating in this data sharing group (the group which includes the IRLM processing the request).

Use the information in message [#unique_157](#) to interpret the output.

Example 5: Assume that this command is issued in a non-data-sharing environment. Enter the following command on the system console:

```
MODIFY DB1GIRLM,STATUS,ALLI
```

The response on the console is as follows:

```
11.11.03 STC00082 DXR103I DJ1G001 STATUS C
IRLMS PARTICIPATING IN DATA SHARING GROUP FUNCTION LEVEL=2.022
IRLM_NAME IRLMID STATUS LEVEL SERVICE MIN_LEVEL MIN_SERVICE
DJ1G      001    UP   2.022 HIR2220    1.022    PQ523690
DXR103I End of display
```

Explanation: The output shows information only for the specified IRLM. The group function level that is shown is the function level for the specified IRLM.

Use the information in message [#unique_157](#) to interpret the output.

Example 6: Enter the following command on the system console:

```
MODIFY IR21PROC,STATUS,STOR
```

The response on the console is as follows:

```
DXR100I IR21021 STOR STATS
PC: YES  LTEW:n/a LTE:      M RLE:      RLEUSE:
BB PVT: 1495M AB PVT (MEMLIMIT): 16383P
CSA USE: ACNT: 0K AHWM: 0K CUR: 312K HWM: 312K
        ABOVE 16M: 16 312K BELOW 16M: 0 0K
        AB CUR: 25M AB HWM: 150M
PVT USE: BB CUR: 4377K AB CUR: 5M
        BB HWM: 1.5M AB HWM: 12M
CLASS  TYPE SEGS  MEM  TYPE SEGS  MEM  TYPE SEGS  MEM
ACCNT  T-1   2    4M   T-2   1    1M   T-3   1    4K
PROC   WRK   4    20K  SRB    1    1K   OTH   1    1K
MISC   VAR   8    4310K N-V   12   323K  FIX   1    24K
*****
*                IRLM Subpool Storage Stat                *
*****
POOLNAME  PTYPE  STORAGE  #SEGMENTS  #ELEM/S  #EXPN  #CMPR
pname    ptype  pstor     psecs     pelems   pexpn   pcmpr
DXR100I  END OF DISPLAY
```

Explanation: The example shows that current storage allocated for IRLM is 312 KB, and the greatest amount that has been allocated since the last time IRLM was started is also 312 KB. The storage for the locking structures (RHB and RLB) is contained within IRLM private storage.

Use the information in message [#unique_154](#) to interpret the output.

Example 7: Enter the following command on the system console:

```
MODIFY PR21PROC,STATUS,TRACE
```

The command displays the following output on the system console:

```
DXR179I PR21034 TRACE USAGE
TRACE BUFFER STORAGE IN USE:    256 KB
MAXIMUM NUMBER OF TRACE BUFFERS ALLOWED PER TRACE TYPE:    10
TRACE TYPE    ACTIVE    BUFFERS IN USE    CTRACE WRITER
-----
SLM            N            0            N
XIT            Y            2            N
XCF            N            0            N
DBM            N            0            N
EXP            Y            1            N
INT            Y            1            N
```

Explanation: This example shows that the storage currently allocated for IRLM tracing is 256 KB, the maximum number of trace buffers allowed per trace type is set to 10, and the external CTRACE writer is not active.

Use the z/OS TRACE CT command to activate or deactivate traces. You cannot turn off the EXP and INT traces. The XIT (for data sharing), EXP, and INT traces are automatically activated when you start IRLM. All traces are automatically activated with IRLMPROC TRACE=YES.

The trace size for each buffer is 64 KB. Use the MODIFY irlmproc,SET,TRACE= *nnn* command to change the maximum number of trace buffers.

Use the information in message [#unique_159](#) to interpret the output.

Example 8: Enter the following command on the system console:

```
MODIFY IR21I,STATUS,MAINT
```

The command displays the following output on the system console:

```
DXR104I IR21240 MAINTENCE LEVELS
  LMOD.Csect    MaintLv    Date          Csect    APAR    DATE
DXRRLM00.DXRRL010 PQ35083 02/22/00  DXRRL020 PQ35083 02/22/00
      DXRRL030 PQ27464 08/18/99  DXRRL040 PQ35083 02/22/00
```

Explanation: The output shows the maintenance levels of IRLM load module CSECTS in a two-column format.

Use the information in message [#unique_158](#) to interpret the output.

Chapter 55. -MODIFY TRACE (Db2)

The Db2 command MODIFY TRACE changes the IFCIDs (trace events) associated with a particular active trace.

The Db2 command MODIFY TRACE completes the following actions:

- Changes the trace events (IFCIDs) being traced for a particular active trace.
- Stops any IFCID previously active for the specified trace.
- Writes statistics records.

Abbreviation: -MOD TRA

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Traces started by a IFI/IFC program: Before you modify an active trace, ensure that an IFI application program or the IFC Selective Dump utility (DSN1SDMP) did not start the trace. If you modify a trace started by DSN1SDMP, the DSN1SDMP utility abnormally terminates. When DSN1SDMP terminates, it stops the trace. This stop could interfere with the MODIFY TRACE command, which stops and restarts the trace.

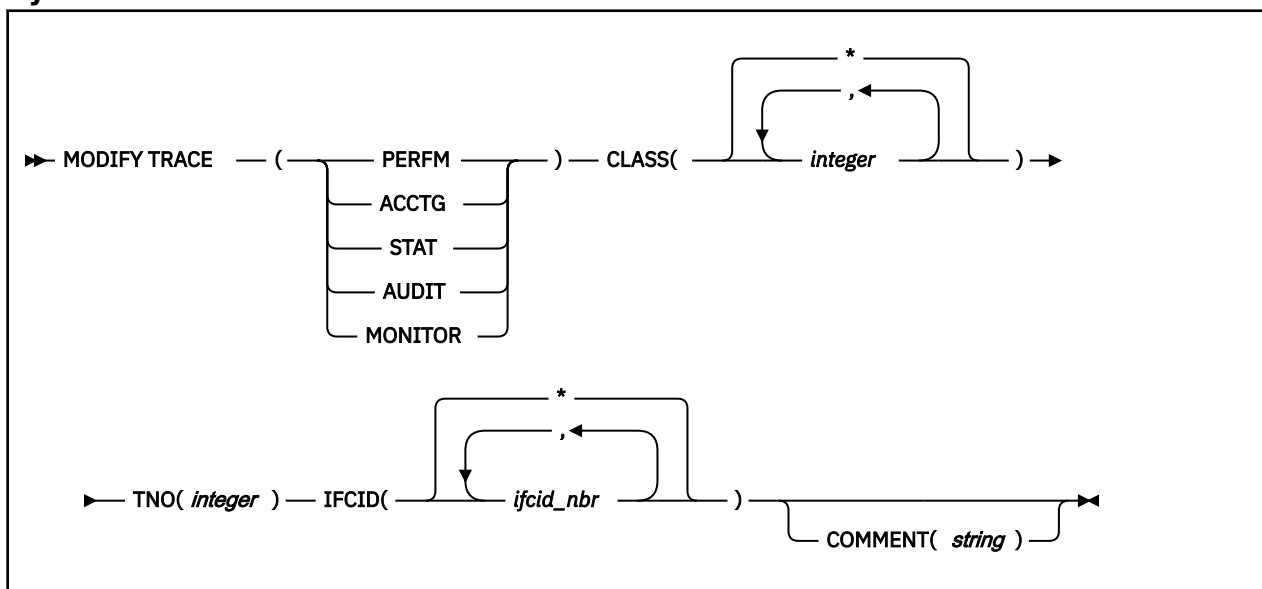

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- TRACE privilege
- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority
- SECADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

TRACE

Determines which IFCIDs are started. The following table lists each trace type, its abbreviation, and a brief description of each type.

One additional trace type is not described in the table because it is intended for service and is to be used under the direction of IBM Support.

Table 20. Trace types

Type	Abbreviation	Description
PERFM	P	Performance records of specific events
ACCTG	A	Accounting records for each transaction
STAT	S	Statistical data
AUDIT	AU	Audit data
MONITOR	MON	Monitor data

CLASS(*integer* , ...)

Limits the list to IFCIDs started for specified classes.

Abbreviation: C

integer is a class to which the list of IFCIDs started is limited.

The **default** is CLASS(*), which starts all default IFCID classes.

TNO(*integer*)

Specifies the particular trace to be modified, identified by its trace number (1 to 32, 01 to 09). You can specify only one trace number. TNO is a required option for the MODIFY TRACE command.

No default exists for the TNO keyword.

IFCID(*ifcid_nbr* , ...)

Specifies which other IFCIDs (trace events), in addition to those IFCIDs contained in the classes specified in the CLASS option, are to be started. To start only those IFCIDs specified in the IFCID option, use trace classes 30-32. These classes have no predefined IFCIDs and are available for a location to use.

If you do not specify the IFCID option, only those IFCIDs contained in the activated trace classes are started.

The maximum number of IFCIDs is 156. The range of values that are valid for the IFCID option is 1 through 350, with the exception of: 4, 5, 185, 187, 217, 232, 234, 240, and 241.

The **default** is IFCID(***) .

COMMENT (*string*)

Specifies a comment that is reproduced in the trace output record (except in the resident trace tables).

string is any character string; it must be enclosed between apostrophes if it includes a blank, comma, or special character.

Example

Example 1:Change trace number six so that it collects only statistics and accounting data. You can define CLASS(30) at your site.

```
-MODIFY TRACE(S) IFCID(1,2,3) TNO(6) CLASS(30)  
COMMENT ('STATS AND ACCOUNTING ON')
```

Related reference

-STOP TRACE (Db2)

The Db2 command STOP TRACE stops tracing.

-START TRACE (Db2)

The Db2 command START TRACE starts Db2 traces.

-DISPLAY TRACE (Db2)

The Db2 command DISPLAY TRACE displays a list of active traces.

Chapter 56. REBIND PACKAGE (DSN)

The DSN subcommand REBIND PACKAGE rebinds an application package when you make changes that affect the package, but have not changed the SQL statements in the program.

This command can be used to rebind a package for an advanced trigger. Issuing the REBIND PACKAGE command with a trigger created prior to the activation of function level 500 or higher or with a basic trigger results in an error.

For example, you can use REBIND PACKAGE after you complete the following activities:

- Migrate to a new Db2 release
- Apply maintenance to Db2
- Modify authorizations
- Create a new index that statements in the package can use
- Collect statistics using the RUNSTATS utility or with another utility by using the STATISTICS keyword

For a trigger package for an advanced trigger, you can use REBIND PACKAGE to:

- Reoptimize SQL statements in the trigger after you create a new index or use the RUNSTATS utility
- Change some of the default bind options that were used when the package was created
- Make a trigger package valid after it was marked as invalid because an object on which the trigger was dependent was dropped

You can use REBIND PACKAGE to change the default rest service version for an existing REST service.

REBIND PACKAGE is generally faster and more economical than BIND PACKAGE. You should use BIND PACKAGE with the ACTION(REPLACE) option under the following conditions:

- When you change the SQL statements
- When you recompile the program
- When you have previously run BIND PACKAGE with the SQLERROR(CONTINUE) option

When the REBIND PACKAGE(*) command is issued, the only affected trigger packages are those for advanced triggers that the issuer is authorized to rebind.

FL 505

The REBIND PACKAGE command may create a new current copy of the package, while retaining the existing current copy as a phase-out copy. This is called *rebind phase-in*. There may be multiple copies of an existing package, but there will only ever be one current copy. There may be one original copy, one previous copy, and multiple phased-out copies.

The current copy, with copy ID 0 (or non-0) is stored in the catalog table SYSPACKAGE. The previous and original copies have copy ID 1 and 2 respectively, and can be found in the SYSPACKCOPY table. All phased-out copies have a copy ID other than 1 and 2 and can be found in SYSPACKCOPY as well.

The package copy that a thread executes can be found in the package accounting trace record. That copy can be either current or phased-out. Db2 might delete the phased-out copies on subsequent executions of the REBIND PACKAGE command. You may want to quiesce threads which execute the phased-out copies and then rebind the package to reduce storage incurred by phased-out copies.

Rebind phase-in is supported for the following options:

- APREUSE(NONE) PLANMGMT(EXTENDED)
- APREUSE(WARN) PLANMGMT(EXTENDED) APREUSESOURCE(CURRENT)
- APREUSE(ERROR) PLANMGMT(EXTENDED) APREUSESOURCE(CURRENT)
- The package is not a generated package for a trigger or SQL routine, such as a procedure or user-defined function.

Db2 waits for the duration specified by the IRLMRWT subsystem parameter before it creates package copies for the rebind phase-in operation.

Environment

You can use REBIND PACKAGE through DB2I, or enter the REBIND PACKAGE subcommand from a DSN session running in foreground or background.

Data sharing scope: Group

Authorization

The package owner must have authorization to execute **all** SQL statements embedded in the package for REBIND PACKAGE to build a package without producing error messages. For VALIDATE(BIND), Db2 verifies the authorization at bind time. For VALIDATE(RUN), Db2 verifies the authorization initially at bind time, but if the authorization check fails, Db2 rechecks it at run time.

When the EXPLAIN(ONLY) the option is specified, you must have the EXPLAIN privilege.

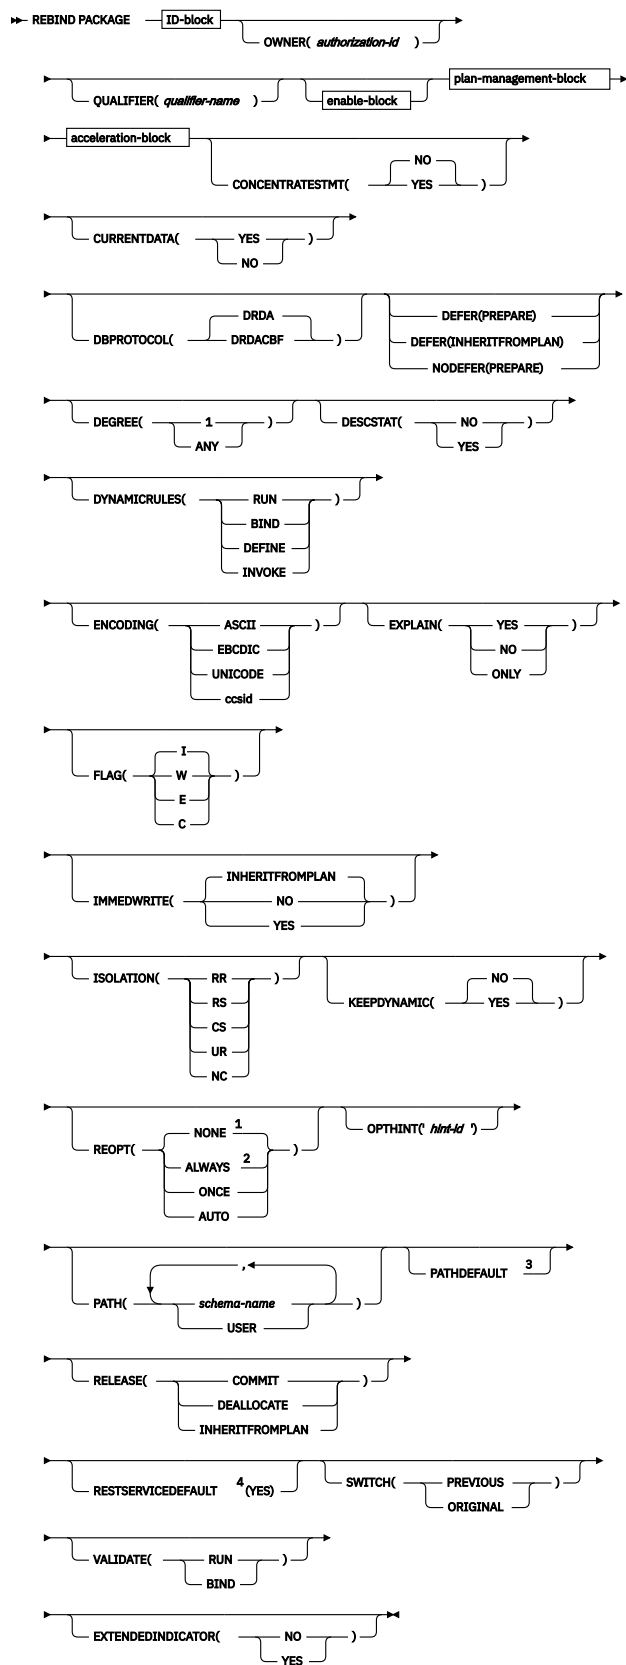

The package owner must be a role to execute REBIND PACKAGE in a trusted context with role ownership.

The following table explains the authorization required to run REBIND PACKAGE, depending on the options specified.

Table 21. Summary of privileges for REBIND PACKAGE

Option	Authorization required to run REBIND PACKAGE
REBIND PACKAGE with no change in ownership because the OWNER keyword is not specified.	<p>The authorization IDs of the process must have one of the following authorities:</p> <ul style="list-style-type: none">• Ownership of the package• BIND privilege on the package• BINDAGENT privilege from the owner of the package• PACKADM authority on the collection or on all collections• SYSADM or SYSCTRL or System DBADM authority
REBIND PACKAGE with no change in ownership, although the original owner is specified for the OWNER keyword.	<p>The authorization IDs of the process must have one of the following authorities:</p> <ul style="list-style-type: none">• OWNER <i>authorization-id</i> must be one of the primary or secondary authorization IDs of the binder• BINDAGENT privilege from the owner of the package
REBIND PACKAGE with change of ownership. (An authorization ID that is not the original owner is specified in the OWNER keyword.)	<p>The new OWNER must have one of the following authorities:</p> <ul style="list-style-type: none">• BIND privilege on the package• PACKADM authority on the collection or on all collections• SYSADM or SYSCTRL or System DBADM authority <p>Specifying the OWNER: If any of the authorization IDs have the BINDAGENT privilege granted from the owner, the <i>authorization-id</i> can specify the grantor as OWNER. Otherwise, OWNER <i>authorization-id</i> must be one of the primary or secondary authorization IDs of the binder.</p>

Syntax

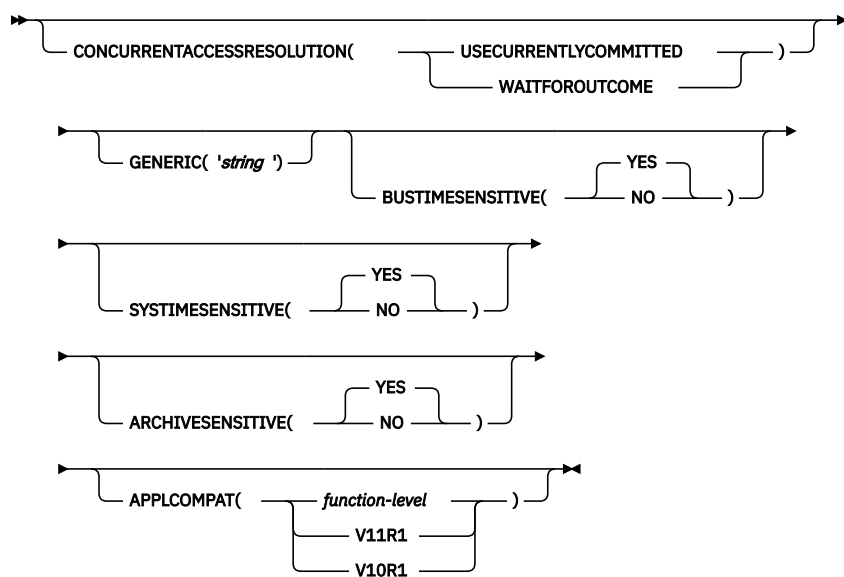

Notes:

¹ NOREOPT(VARS) can be specified as a synonym of REOPT(NONE)

² REOPT(VARS) can be specified as a synonym of REOPT(ALWAYS)

³ The PATHDEFAULT keyword is mutually exclusive with the PATH keyword. Do not specify both keywords in the same REBIND command.

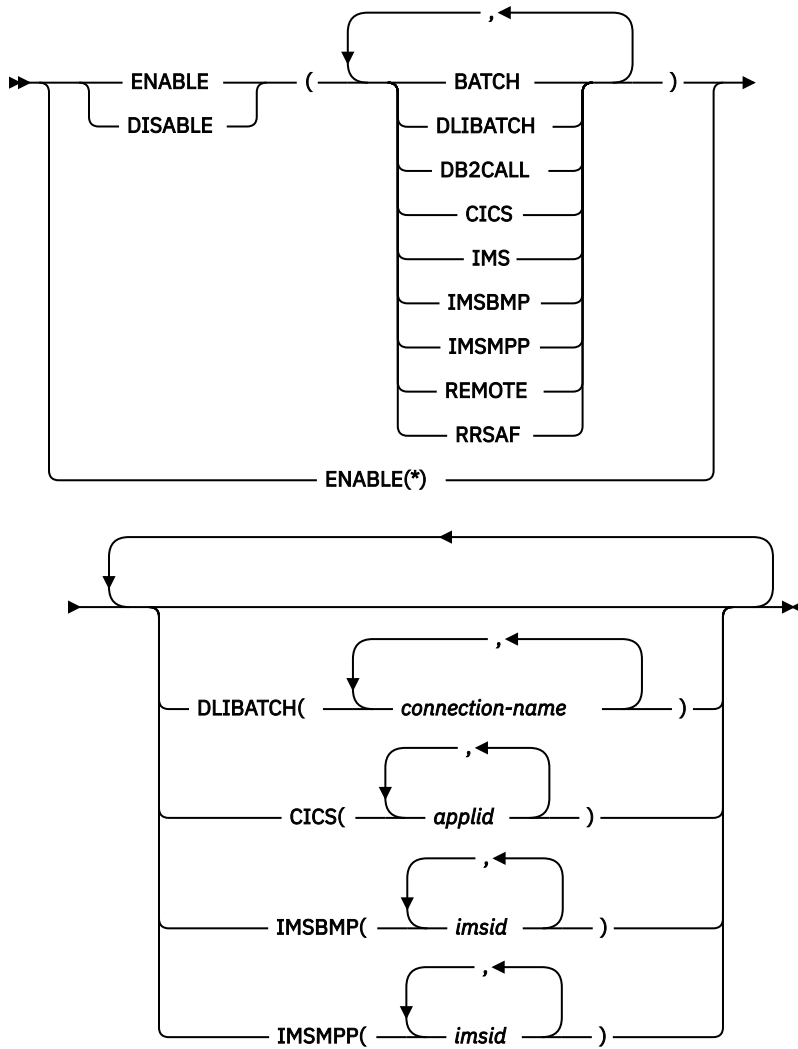

⁴ The RESTSERVICEDEFAULT option is only valid for local REST service packages.

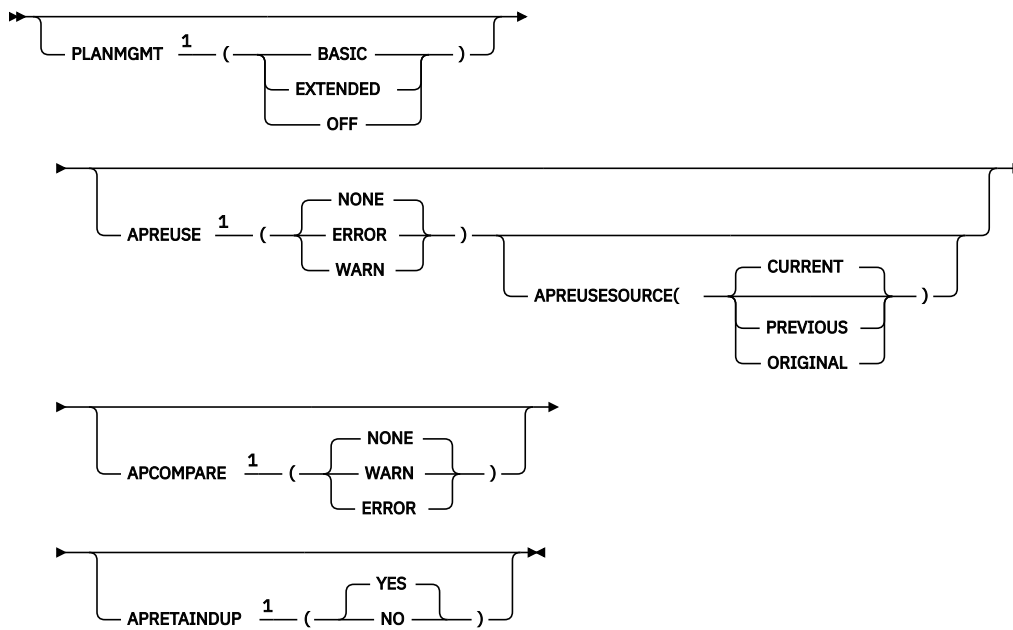

ID-block

enable-block

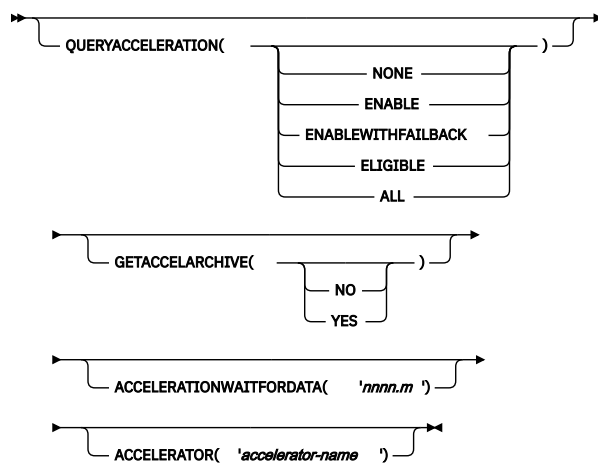

plan-management-block

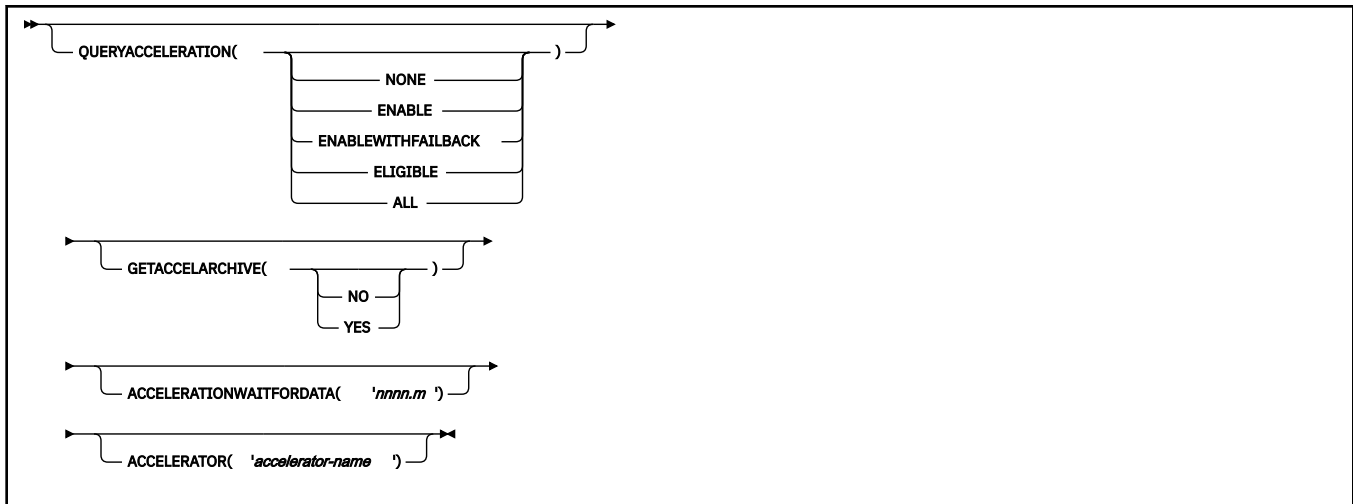

Notes:

¹ This option is not supported for trigger packages.

acceleration-block

Option descriptions

For descriptions of the options shown in the syntax diagram, see the topic [Chapter 14, “BIND and REBIND options for packages, plans, and services ,” on page 77.](#)

Usage notes

Rebinding multiple packages: If you rebind multiple packages, Db2 commits each successful rebind before rebinding the next package.

Rebinding a package for a native SQL procedure: If you issue a REBIND PACKAGE command against a native SQL procedure package, the only bind options that you can change are EXPLAIN, PLANMGMT, SWITCH, APRETAINDUP, APREUSE, APREUSESOURCE, and APCOMPARE. If you try to change other bind options the command will fail and return message DSNT215I. The REBIND PACKAGE command rebinds only the SQL statements included in the procedure and not the control statements in the procedure definition.

Rebinding a package for an SQL function: If you issue a REBIND PACKAGE command against a package for an SQL function, the only bind options that you can change are EXPLAIN, PLANMGMT, and SWITCH. If you try to change other bind options, the command will fail and return message DSNT215I. The REBIND PACKAGE command rebinds only the SQL statements included in the function and not the control statements in the function definition.

Rebinding a package for a trigger: Although DBCS characters are generally allowed in trigger names, trigger names that contain DBCS characters cannot be used in REBIND TRIGGER PACKAGE operations. If you issue a REBIND PACKAGE command against a package for an advanced trigger, the only bind options that you can change are EXPLAIN, FLAG, PLANMGMT, and CONCENTRATESTMT. If you try to change other bind options, the command will fail and return message DSNT215I. The REBIND PACKAGE command rebinds only the SQL statements included in the trigger and not the control statements in the trigger definition.

Restrictions on trigger packages: A trigger package can be explicitly rebound, but it cannot be explicitly bound using the BIND PACKAGE subcommand. A trigger package cannot be explicitly freed using the FREE PACKAGE sub-command or the DROP PACKAGE statement. Use the DROP TRIGGER statement to delete the trigger package. A trigger package cannot be copied, and it can only be rebound locally. Remote rebind of a trigger package is not allowed.

Example

Rebind packages TEST.DSN8BC81.(MAY_VERSION) and PRODUCTION.DSN8BC81.(DEC_VERSION), both of which are located at the local location USIBMSTODB22. The packages can run only from the CICS or

the DLIBATCH environments if the connection ID is CON2. This replaces the CON1 that is specified on the BIND PACKAGE command.

```
REBIND PACKAGE (USIBMST0DB22.TEST.DSN8BC81.(MAY_VERSION),  
               USIBMST0DB22.PRODUCTION.DSN8BC81.(DEC_VERSION)) -  
  ENABLE (CICS,DLIBATCH) CICS (CON2)
```

Related reference

REBIND PLAN (DSN)

The DSN subcommand REBIND PLAN rebinds an application plan when you make changes to the attributes of the plan, such as the package list.

BIND PACKAGE (DSN)

The DSN subcommand BIND PACKAGE builds an application package. Db2 records the description of the package in the catalog tables and saves the prepared package in the directory. BIND PACKAGE also deletes phased-out package copies.

BIND and REBIND options for packages, plans, and services

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

Chapter 57. REBIND PLAN (DSN)

The DSN subcommand REBIND PLAN rebinds an application plan when you make changes to the attributes of the plan, such as the package list.

For example, you can use REBIND PLAN when you change authorizations, modify package lists for the plan, or use RUNSTATS. If the rebind is successful, the process prepares an application plan and updates its description in the catalog table SYSPLAN.

REBIND PLAN is generally faster and more economical than BIND PLAN. But if you change the SQL statements or recompile a program, you should use BIND PLAN with the option ACTION(REPLACE).

Environment

You can use REBIND PLAN through DB2I, or enter the REBIND PLAN subcommand from a DSN session running in foreground or background.

Data sharing scope: Group

Authorization

The plan owner must have authorization to execute **all** SQL statements embedded in the plan for REBIND PLAN to build a plan without producing error messages. For VALIDATE(BIND), Db2 verifies the authorization at bind time. For VALIDATE(RUN), Db2 initially verifies the authorization at bind time, but if the authorization check fails, Db2 rechecks it again at run time. If you use the PKLIST keyword, you must have EXECUTE authority for the packages or collections specified on PKLIST.

The plan owner must be a role to execute REBIND PLAN in a trusted context with role ownership.

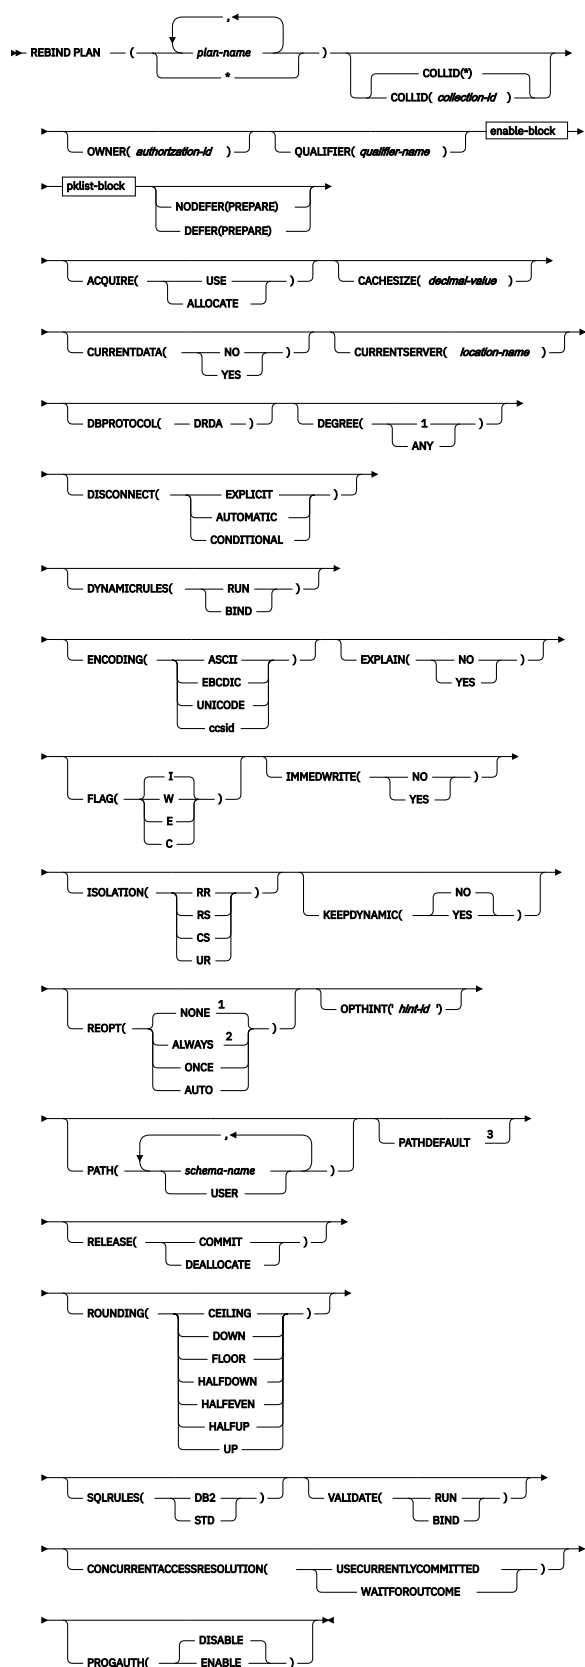

The following table explains the authorization required to run REBIND PLAN, depending on the options specified.

Table 22. Summary of privileges for REBIND PLAN	
Option	Authorization required to run REBIND PLAN
REBIND PLAN with no change in ownership because the OWNER keyword is not specified.	<p>The authorization IDs of the process must have one of the following authorities:</p> <ul style="list-style-type: none">• Ownership of the plan• BIND privilege on the plan• BINDAGENT privilege from the owner of the plan• SYSADM or SYSCTRL or System DBADM authority
REBIND PLAN with no change in ownership, although the original owner is specified for the OWNER keyword.	<p>The authorization IDs of the process must have one of the following authorities:</p> <ul style="list-style-type: none">• OWNER <i>authorization-id</i> must be one of the primary or secondary authorization IDs of the binder• BINDAGENT privilege from the owner of the plan• SYSADM or SYSCTRL or System DBADM authority

Table 22. Summary of privileges for REBIND PLAN (continued)

Option	Authorization required to run REBIND PLAN
REBIND PLAN with change of ownership. (An authorization ID that is not the original owner is specified in the OWNER keyword.)	<p>The new OWNER must have one of the following authorities:</p> <ul style="list-style-type: none"> • BIND privilege on the plan • SYSADM or SYSCTRL or System DBADM authority <p>Specifying the OWNER: If any of the authorization IDs has the BINDAGENT privilege granted from the owner, then <i>authorization-id</i> can specify the grantor as OWNER. Otherwise, OWNER <i>authorization-id</i> must be one of the primary or secondary authorization IDs of the binder.</p>
COLLID, specifying (*), indicating all packages in the collection	You do not need any authorization privileges for this option.
COLLID, specifying individual packages	<p>Authorization ID of the process must include one of the following authority:</p> <ul style="list-style-type: none"> • CREATEIN privilege on the COLLID you specified.
PKLIST, specifying individual packages	<p>Authorization ID of the process must include one of the following authorities:</p> <ul style="list-style-type: none"> • EXECUTE privilege on each package specified in the PKLIST • PACKADM authority on specific collections containing packages or on collection * • SYSADM or DATAACCESS authority
PKLIST, specifying (*), indicating all packages in the collection	<p>Authorization ID of the process must include one of the following authorities:</p> <ul style="list-style-type: none"> • EXECUTE privilege on <i>collection-id</i> * • PACKADM authority on <i>collection-id</i> or on * • SYSADM or DATAACCESS authority

Syntax

Notes:

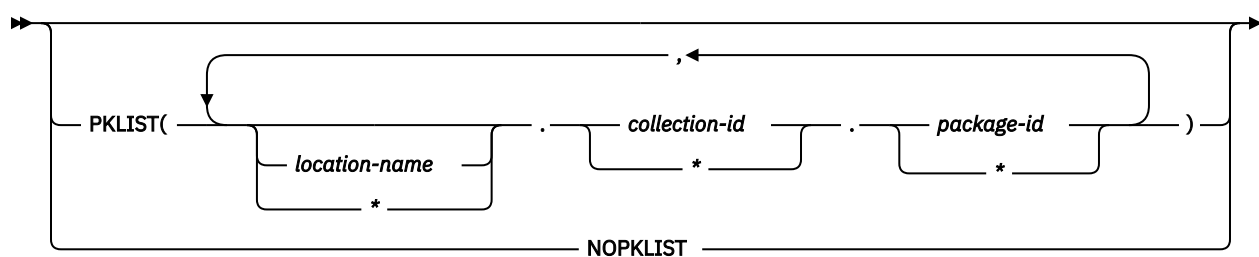

¹ REOPT(VARS) can be specified as a synonym of REOPT(ALWAYS)

- ² NOREOPT(VARS) can be specified as a synonym of REOPT(NONE)
- ³ The PATHDEFAULT keyword cannot be specified with the PATH keyword.

enable-block

pklist-block

Option descriptions

For descriptions of the options shown in the syntax diagram, see the topic [Chapter 14, “BIND and REBIND options for packages, plans, and services,”](#) on page 77.

Usage notes

Rebinding multiple plans: If you rebind multiple plans, Db2 commits each successful rebind before rebinding the next plan.

When you cannot rebind a plan: You cannot rebind a plan while that plan is executing.

Examples

Example: Rebinding a plan to replace the package list

Suppose that PLANA uses package list COLLA.* Suppose that you want to replace that package list with COLLB.* Issue a command like this one:

```

REBIND PLAN (PLANA) -
  PKLIST(COLLB.*) -
  FLAG(W) -
  VALIDATE(BIND) -
  ISOLATION(CS)
  
```

This REBIND command also does the following things:

- Uses FLAG(W) to issue warning, error, and completion messages, but not informational messages.
- Uses VALIDATE(BIND) to point out any error conditions during the bind process.

- Uses ISOLATION(CS) to prevent other applications from changing the database values that this application uses only while the application is using them. This isolation level protects changed values until the application commits or terminates. In this example, the isolation is not set for the packages, so ISOLATION(CS) becomes the isolation level for the plan and the packages.
- Omits the OWNER keyword to leave the plan's owner authorization ID the same.
- Omits the ENABLE or DISABLE keywords to use the connections previously defined for the plan.

Related referenceREBIND PACKAGE (DSN)

The DSN subcommand REBIND PACKAGE rebinds an application package when you make changes that affect the package, but have not changed the SQL statements in the program.

BIND PLAN (DSN)

The DSN subcommand BIND PLAN builds an application plan. All Db2 programs require an application plan to allocate Db2 resources and support SQL requests made at run time.

BIND and REBIND options for packages, plans, and services

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

Chapter 58. REBIND TRIGGER PACKAGE (DSN)

The DSN subcommand REBIND TRIGGER PACKAGE rebinds a package for a basic trigger. You can identify basic triggers by querying the SYSIBM.SYSTRIGGERS catalog table. Blank values in the SQLPL column identify basic triggers. For advanced triggers, use the REBIND PACKAGE command instead.

You can use this subcommand to change a limited subset of the default bind options that Db2 used when creating the package. You might also rebind a trigger package to re-optimize its SQL statements after you create a new index or use the RUNSTATS utility. Additionally, you can rebind a trigger package if it has been marked invalid because an index, or another object it was dependent on, was dropped.

If the rebind is successful, the trigger package is marked valid. When the REBIND TRIGGER PACKAGE(*) command is issued, the only affected trigger packages are those for basic triggers that the issuer is authorized to rebind.

Trigger packages cannot be rebound remotely. The location name is permitted when specifying the package name on a REBIND TRIGGER PACKAGE subcommand. However, the location name must not refer to a remote location.

Environment

You can use REBIND TRIGGER PACKAGE through DB2I, or enter the REBIND TRIGGER PACKAGE subcommand from a DSN session that is running in foreground or background.

Data sharing scope: Group

Authorization

To build a package without producing error messages, the package owner must have authorization to execute **all** SQL statements that are embedded in the package for REBIND TRIGGER PACKAGE.

To execute this subcommand, you must use a privilege set of the process that includes one of the following privileges or authorities:

- Ownership of the trigger package
- BIND privilege on the trigger package
- BINDAGENT privilege from the owner of the trigger package
- PACKADM authority on the collection or on all collections
- System DBADM authority
- SYSCTRL authority
- SYSADM authority

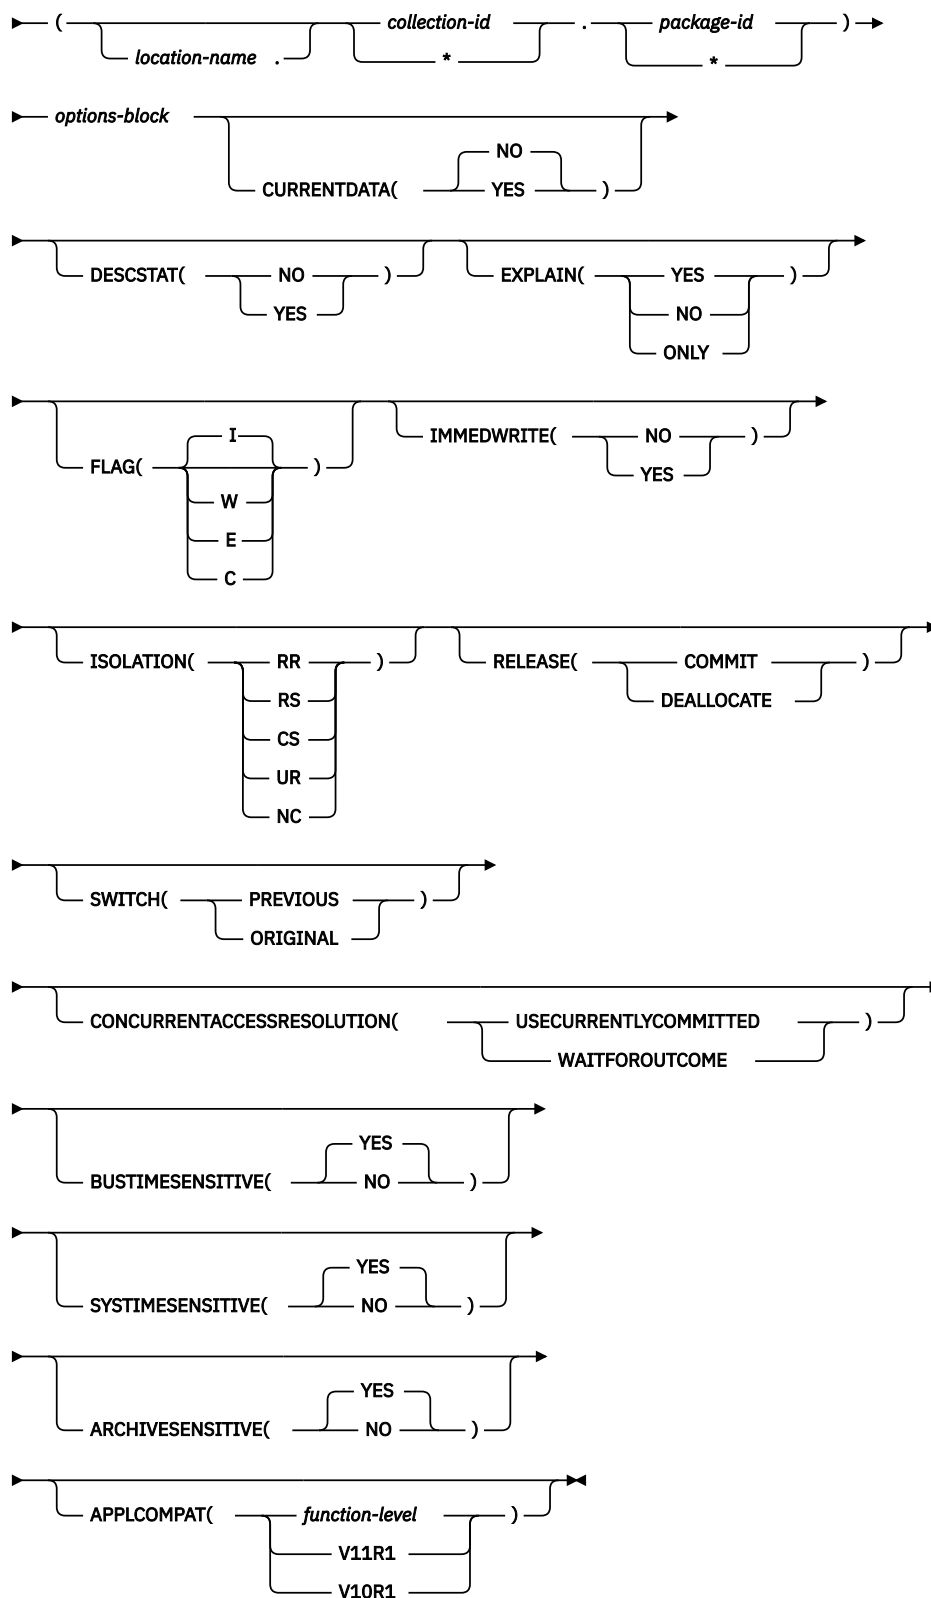

When the trigger package is bound, the privileges of the current authorization ID are used when checking authority to bind statements within the triggered action. On REBIND TRIGGER PACKAGE, you need one of the following privileges or authorities:

- Ownership of the trigger package
- BIND privilege on the trigger package
- BINDAGENT privilege from the owner of the trigger package
- PACKADM authority on the collection or on all collections
- System DBADM authority
- SYSCTRL authority
- SYSADM authority

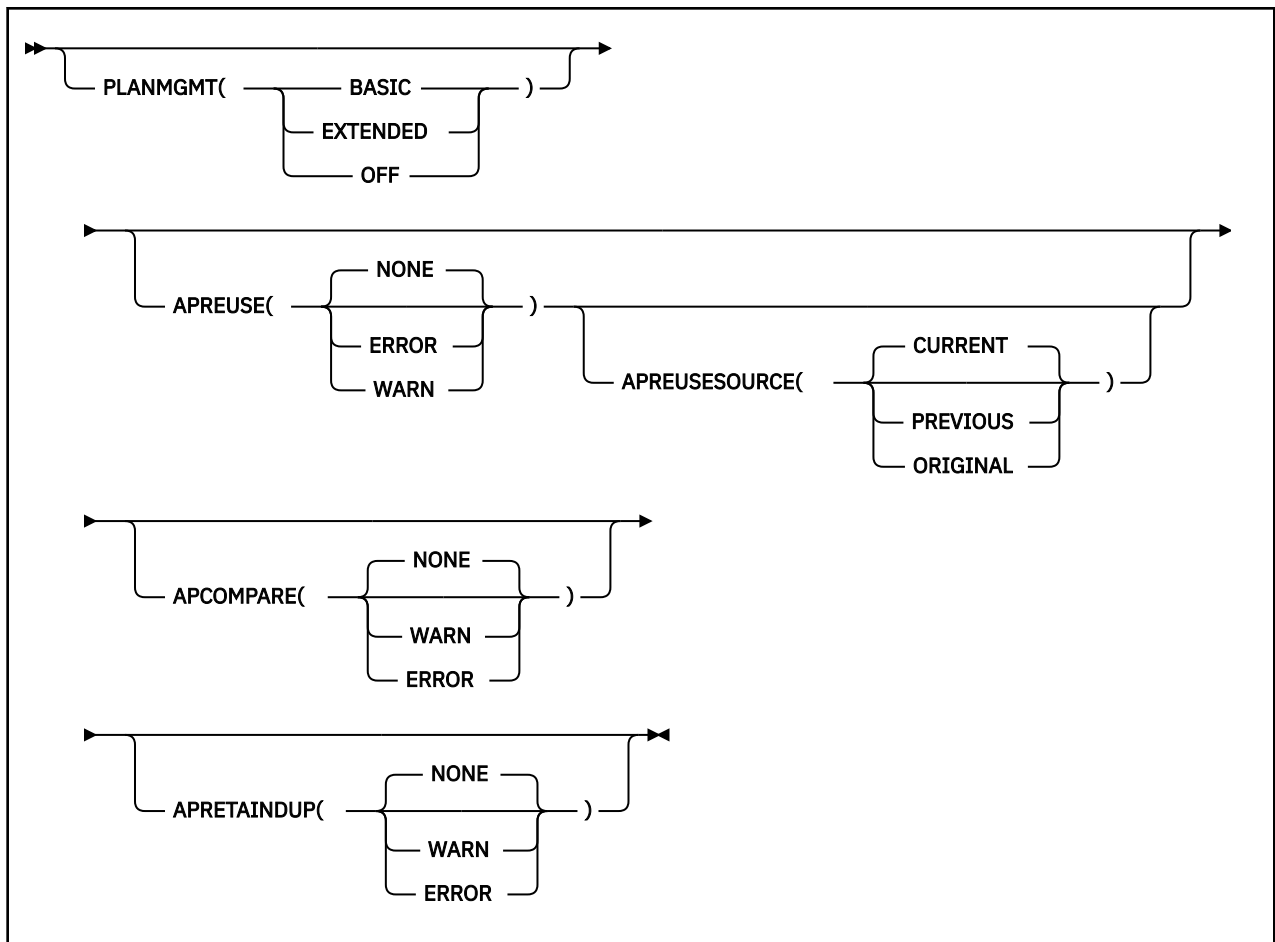

When the EXPLAIN(ONLY) the option is specified, you must have the EXPLAIN privilege.

Syntax

► REBIND TRIGGER PACKAGE ►

options-block

Option descriptions

TRIGGER PACKAGE

Determines what trigger package or packages to rebind. The trigger package must be associated with a basic trigger.

The following options identify the location, collection, and package name of the package. You can identify a location and collection. For REBIND TRIGGER PACKAGE, you must identify a trigger package name.

location-name

Identifies the current local location. Remote rebind of a trigger package is not allowed. *location-name* is the location of the DBMS where the package rebinds and where the description of the package resides.

The **default** is the local DBMS.

collection-id or *

Identifies the schema-name that already contains the trigger package to rebind. No default exists.

For REBIND TRIGGER, you can use an asterisk (*) to rebind all local packages with the specified *package-id* in all the collections for which you have bind privileges.

package-id or *

Identifies the name of the trigger package to rebind, as listed in the NAME column of the SYSPACKAGE catalog table. No default exists.

You can use the pattern-matching character (*) to rebind all local triggers in *collection-id* for which you have bind privileges.

For descriptions of the options that are shown in the syntax diagram, see the topic [Chapter 14, “BIND and REBIND options for packages, plans, and services ,” on page 77.](#)

Usage notes

Restrictions on trigger packages

A trigger package can be explicitly rebound, but it cannot be explicitly bound using the BIND PACKAGE subcommand.

A trigger package cannot be explicitly freed using the FREE PACKAGE subcommand or the DROP PACKAGE statement. Use the DROP TRIGGER statement to delete the trigger package.

A trigger package cannot be copied, and it can only be rebound locally. Remote rebind of a trigger package is not allowed.

Rebinding multiple trigger packages

If you rebind multiple trigger packages, Db2 commits each successful rebind before rebinding the next package.

Restriction on trigger names

Although DBCS characters are generally allowed in trigger names, trigger names that contain DBCS characters cannot be used in REBIND TRIGGER PACKAGE operations.

Output

REBIND TRIGGER PACKAGE updates the COLLID and NAME columns in the SYSPACKAGE catalog table.

Example

Enter the following command to rebind trigger package TRIG1 in the ADMF001 collection of packages:

```
REBIND TRIGGER PACKAGE (ADMF001.TRIG1);
```

This command produces output that is similar to the following output:

```
DSNT254I - DSNTBRB2 REBIND OPTIONS FOR
           PACKAGE = STLEC1.ADMF001.TRIG1.()
           ACTION
           OWNER          ADMF001
           QUALIFIER      ADMF001
           VALIDATE       BIND
           EXPLAIN        NO
           ISOLATION      CS
           RELEASE        COMMIT
           COPY
DSNT255I - DSNTBRB2 REBIND OPTIONS FOR
           PACKAGE = STLEC1.ADMF001.TRIG1.()
           SQLERROR       NOPACKAGE
           CURRENTDATA    YES
           DEGREE         1
           DYNAMICRULES   BIND
           NODEFER        PREPARE
           REOPT          NONE
           KEEP_DYNAMIC   NO
           DBPROTOCOL     DRDA
           QUERYOPT       1
           PATH
"SYSIBM", "SYSFUN", "SYSPROC", "SYSADM", "ADMF001"
DSNT232I - SUCCESSFUL REBIND FOR
           PACKAGE = STLEC1.ADMF001.TRIG1.()
```

[CREATE TRIGGER \(basic\) \(Db2 SQL\)](#)

Chapter 59. -RECOVER BSDS (Db2)

The Db2 command RECOVER BSDS reestablishes dual bootstrap data sets (BSDS) after one has been disabled by a data set error.

Follow these steps to reestablish dual BSDS mode:

1. Use access method services to rename or delete the failing BSDS, which the Db2 system has deallocated, and define a new BSDS with the same name as the failing BSDS. You can find control statements in job DSNTIJIN.
2. Issue the Db2 command RECOVER BSDS to make a copy of the remaining BSDS in the newly allocated data set and to reestablish dual BSDS mode.

Abbreviation: -REC BSDS

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- BSDS privilege
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

►► RECOVER BSDS ◄◄

Example

Reestablish dual BSDS mode.

```
-RECOVER BSDS
```

Related tasks

Adding a second BSDS (Db2 Installation and Migration)

[Recovering the BSDS from a backup copy \(Db2 Administration Guide\)](#)

Chapter 60. -RECOVER INDOUBT (Db2)

The Db2 command RECOVER INDOUBT recovers threads that are left in an indoubt state because Db2 or a transaction manager could not automatically resolve the indoubt status with the commit coordinator.

This command should only be used when automatic resolution will not work. The commit coordinator must determine the commit or abort decision.

Abbreviation: -REC IND

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

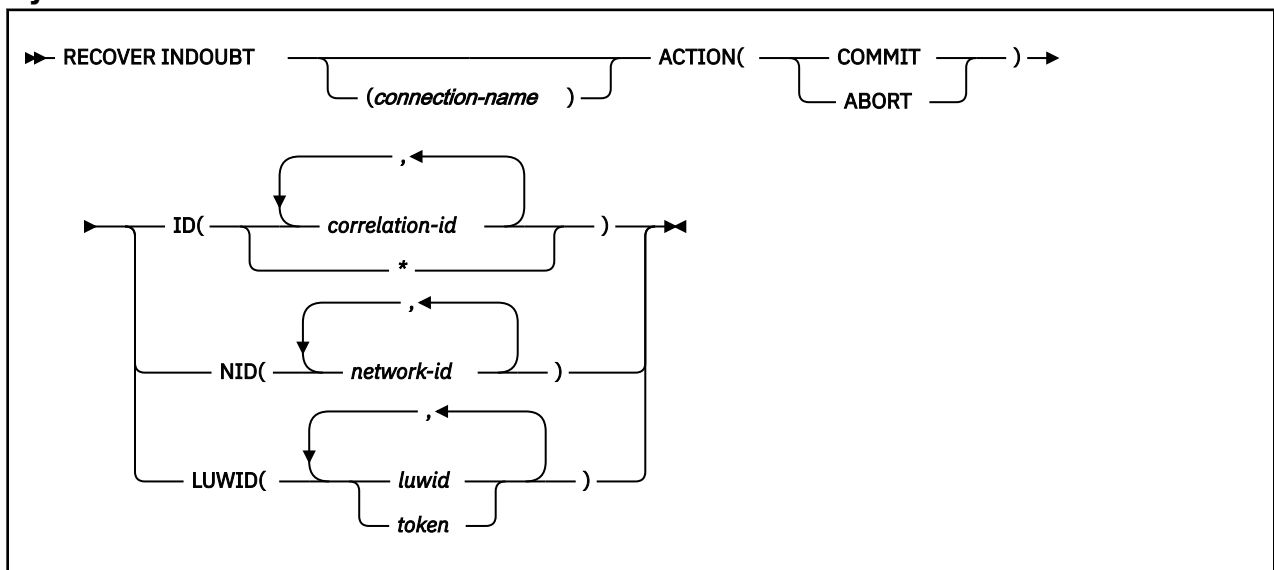

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- RECOVER privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

(*connection-name*)

Specifies a one- to eight-character connection name. Allied threads (including those that are distributed) that belong to the connection name are recovered. This parameter is ignored if LUWID is specified.

The **default** is the connection name from which you enter the command. If you enter this command from a z/OS console, and you are recovering an allied thread using the ID or NID parameter, you **must** supply a connection name; no default connection name is available.

ACTION

Specifies whether to commit or abort the indoubt thread. If there are any downstream participants for which the local thread is the coordinator, the commit or abort decision is propagated to these participants.

Abbreviation: ACT

(COMMIT)

Commits the thread.

(ABORT)

Aborts the thread.

ID(*correlation-id* , ...)

Specifies whether to recover a specific allied thread or all allied threads (including those that are distributed) that are associated with the connection name.

correlation-id

Is the correlation ID (1 to 12 characters) of a specific thread that is to be recovered. If you use more than one correlation ID, separate the IDs with commas.

Do not use a correlation ID that is associated with more than one network ID. Instead, use the NID option.

(*)

Recovers all indoubt threads that are associated with the connection name. Even threads that have the same correlation ID are resolved.

NID(*network-id* , ...)

Specifies the network IDs of threads to recover.

network-id is a network ID that is associated with an individual thread. A single connection might have multiple network IDs associated with it. *network-id* is one of the following types of IDs:

- For IMS and CICS connections, *network-id* is specified as *net-node.number*:

net-node

The network node name of the system that originated the unit of work. *net-node* is one to eight bytes in length.

number

A unique number within the system of origin. *number* is 1 to 16 bytes in length.

- For RRSAF connections, *network-id* is the z/OS RRS unit of recovery ID (URID) that is used to uniquely identify a unit of work. A z/OS RRS URID is a 32-byte number.

The network ID appears in the recovery log of the commit coordinator as a 16-byte unique identification of a unit of work.

- For IMS and CICS connections, the network ID is an 8-byte node name immediately followed by an 8-byte number.
- For RRSAF connections, the network ID is a 16-byte number.

LUWID

Recovers the indoubt thread that has the specified LUWID.

luwid

Consists of an LU network name, an LUW instance number, and a commit sequence number.

The LU network name consists of a one- to eight-character network ID, a period, and a one- to eight-character network LU name. The LUW instance number consists of a period followed by 12 hexadecimal characters. The last element of the LUWID is the commit sequence number of 4 hexadecimal characters, preceded by a period.

token

A token is an alternate way to express an LUWID. Db2 assigns a token to each thread that it creates. It is a one- to six-digit decimal number that appears after the equal sign in all Db2 messages that display a LUWID.

If you enter one- to six-decimal digits, Db2 assumes that you are supplying a token. The token that Db2 assigns to a specific LUWID is unique for that Db2 subsystem, but not necessarily unique across all subsystems.

Usage note

When to use a network ID: A *network-id* is not normally needed, because a *correlation-id* can identify indoubt threads. However, if the *correlation-id* is not unique, *network-id* must be used. You do not need a *network-id* if you specify a LUWID.

If you specify a thread in the command that is part of a global transaction, the command is executed against all threads that are in the global transaction.

Examples

Example 1: Recover indoubt allied threads. Schedule a commit for all threads that are associated with the connection name from which the command is entered.

```
-RECOVER INDOUBT ACTION(COMMIT) ID(*)
```

Example 2: Recover an indoubt thread from a remote requester. Schedule a commit for the indoubt thread whose token is 1332.

```
-RECOVER INDOUBT ACTION(COMMIT) LUWID(1332)
```

Example 3: Recover indoubt threads from remote requesters. Schedule an abort for two indoubt threads. The first thread has an LUWID of DB2NET.LUNSITE0.A11A7D7B2057.0002. (The 0002 in the last segment of the LUWID represents the commit sequence number.) The second thread has a token of 442.

```
-RECOVER INDOUBT ACTION(ABORT)  
LUWID (DB2NET.LUNSITE0.A11A7D7B2057.0002, 442)
```

Chapter 61. -RECOVER POSTPONED (Db2)

The Db2 command RECOVER POSTPONED completes back-out processing for units of recovery that are left incomplete during an earlier restart (POSTPONED ABORT units of recovery). Use this command when automatic resolution is not selected.

Abbreviation: -REC POST

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (DB2 COMMANDS), or an IMS or CICS terminal.

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- RECOVER privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

CANCEL

Specify to stop Db2 processing of all postponed abort units of recovery immediately. Canceling postponed abort units of recovery leaves objects in an inconsistent state.

Objects that the postponed units of recovery modify are recovered (backed out). If back out processing fails, the objects are marked as REFRESH PENDING (REFP) and either RECOVER PENDING (RECP) or REBUILD PENDING (RBDP or PSRBD) in the database exception table. Resolve the REFP status of the object by running the RECOVER utility to recover the object to a prior point in time or by running LOAD REPLACE on the object.

Usage notes

Recovery action: Recovery (rollback) action is always taken for all POSTPONED ABORT units of recovery.

Output

The output from RECOVER POSTPONED consists of informational messages only.

Progression of RECOVER POSTPONED: Message DSNIO24I indicates the completion of backout work against the page set or partition, and the removal of the page set or partition from the restart-pending status.

If backout processing lasts for an extended period of time, progress message DSNR047I is displayed at periodic intervals until backout processing is complete.

Db2 issues message DSN9022I after successful completion of the RECOVER POSTPONED command, or message DSN9023I if the command completed unsuccessfully. Message DSNV434I indicates that RECOVER POSTPONED was issued when no postponed-abort units of recovery needed to be resolved.

Example

Enter the following command to recover postponed-abort units of recovery.

```
-RECOVER POSTPONED
```

If postponed-abort units of recovery are found, output that is similar to the following output is generated:

```
DSNV435I - RESOLUTION OF POSTPONED ABORT URS HAS BEEN SCHEDULED
DSNIO24I - DSNIRPL BACKOUT PROCESSING HAS COMPLETED
          FOR PAGESET DBKD0103.IPKD013A PART 00000004.
DSNIO24I - DSNIRPL BACKOUT PROCESSING HAS COMPLETED
          FOR PAGESET DBKD0103.TPKD0103 PART 00000004.
DSNIO24I - DSNIRPL BACKOUT PROCESSING HAS COMPLETED
          FOR PAGESET DBKD0103.IXKD013C PART (n/a).
DSNIO24I - DSNIRPL BACKOUT PROCESSING HAS COMPLETED
          FOR PAGESET DBKD0103.IUKD013B PART (n/a).
DSNIO24I - DSNIRPL BACKOUT PROCESSING HAS COMPLETED
          FOR PAGESET DBKD0103.IPKD013A PART 00000002.
DSNIO24I - DSNIRPL BACKOUT PROCESSING HAS COMPLETED
          FOR PAGESET DBKD0103.TPKD0103 PART 00000002.
DSNIO24I - DSNIRPL BACKOUT PROCESSING HAS COMPLETED
          FOR PAGESET DBKD0101.IXKD011C PART (n/a).
DSNIO24I - DSNIRPL BACKOUT PROCESSING HAS COMPLETED
          FOR PAGESET DBKD0101.IXKD011B PART (n/a).
DSNIO24I - DSNIRPL BACKOUT PROCESSING HAS COMPLETED
          FOR PAGESET DBKD0101.IUKD011A PART (n/a).
DSNIO24I - DSNIRPL BACKOUT PROCESSING HAS COMPLETED
          FOR PAGESET DBKD0101.TLKD0101 PART (n/a).
DSN9022I - DSNVRP 'RECOVER POSTPONED' NORMAL COMPLETION
```

If no postponed units of recovery are found, the following output is returned:

```
DSNV434I - DSNVRP NO POSTPONED ABORT THREADS FOUND
DSN9022I - DSNVRP 'RECOVER POSTPONED' NORMAL COMPLETION
```

Chapter 62. -REFRESH DB2,EARLY (Db2)

The Db2 command -REFRESH DB2,EARLY reloads the ERLY code modules that were loaded at IPL time, and rebuilds the ERLY control block.

Executing the -REFRESH DB2,EARLY command is an alternative to doing an IPL of z/OS for activating maintenance to early (ERLY) code after you apply that maintenance to the *prefix.SDSNLINK* data set.

When -REFRESH DB2,EARLY is run, previous copies of the ERLY modules are deleted from the system the next time that Db2 is started. This command is only valid when Db2 is inactive.

Restriction: The data set that contains the new ERLY code must have been in the link list concatenation since z/OS IPL time. -REFRESH DB2,EARLY does not search for ERLY code in data sets that were added to the link list after IPL time.

Important: If *prefix.SDSNLINK* is LLA-managed, you must perform an LLA refresh after you apply ERLY code maintenance, and before you issue the -REFRESH DB2,EARLY command. You can perform an LLA refresh by issuing the Db2 for z/OS command MODIFY LLA,REFRESH.

Abbreviation: -REF DB2

Environment

This command can be issued only from a z/OS console. In a non-data-sharing environment, the command must be issued on individual subsystems. In a data sharing environment, the command must be issued on individual members of a data sharing group. The name of the Db2 subsystem is determined by the command prefix. For example, -START indicates that the Db2 subsystem to be started is the one with '-' as the command prefix.

The command is rejected if the Db2 subsystem is already active. The ERLY code can be properly updated only when Db2 is not active.

Applications that use documented Db2 interfaces do not need to be stopped before issuing the REFRESH DB2,EARLY command.

Data sharing scope: Member

Authorization

None is required. However, the command can be executed only from a z/OS console with the START command capability. This command is rejected when Db2 is active, so no other authorization is required.

Syntax

►► -REFRESH DB2,EARLY ◄◄

Option descriptions

The following option is required.

EARLY

Indicates that the ERLY block is to be rebuilt, and that all of the modules that are loaded at IPL time are reloaded.

Scope of the -REFRESH command

The -REFRESH command has member-only scope, and must be executed for every instance where a unique recognition character for the -START command is defined.

After you issue the command, Db2 displays the maintenance levels of the ERLY code modules that were loaded.

Examples

Example: Refreshing the Db2 ERLY code

Suppose that the command prefix for a subsystem is -VC1A. This command reloads the ERLY code modules that were loaded at IPL time, and rebuilds the ERLY control block.

```
-VC1A REFRESH DB2,EARLY
```

After you issue the command, Db2 displays output like the following output:

```
DSN3100I -VC1A DSN3UR00 - SUBSYSTEM VC1A READY FOR START COMMAND
DSN3117I VC1A MAINTENANCE LEVELS
CSECT      DATE      APAR      CSECT      DATE      APAR
DSN3UR00   01/27/05   09.35   DSN3EC0X   01/24/05   09.10
DSN3ECMS   01/13/05   11.16   DSN3RIB    12/13/04   10.46
DSN3RDMP   12/13/04   10.27   DSN3AET03  11/30/04   15.42
DSNAET04   11/30/04   15.42   DSNAPRHO   11/30/04   15.42
DSNAPRHX   12/20/04   10.10   DSNVRMTR   11/30/04   19.53
DSNVRSRB   11/30/04   19.53   DSNZPARS   11/30/04   21.48
DSN3AC0X   11/30/04   21.50   DSN3CL0X   11/30/04   21.51
DSN3DEQ0   11/30/04   21.52   DSN3ENQ0   11/30/04   21.52
DSN3EST0   11/30/04   21.53   DSN3RRSX   11/30/04   21.53
DSN3RRXF   11/30/04   21.54   DSN3RS0X   11/30/04   21.54
DSN3RTR0   11/30/04   21.54   DSN3SPRX   11/30/04   21.54
```

Chapter 63. -RESET GENERICLU (Db2)

The RESET GENERICLU command allows you to purge information stored by VTAM in the coupling facility for one or more partners of a particular Db2 subsystem.

The command must be issued from the Db2 subsystem that has the VTAM affinity to the particular partner LU whose information you are purging.

Abbreviation: -RESET GENERIC

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

(*luname*)

Specifies the real VTAM LU name of the partner whose generic LU name mapping is to be purged. The NETID of this partner LU must be the same as the local Db2 NETID.

(*netid.luname*)

Specifies that the VTAM shared memory information that is associated with the specified NETID and LUNAME is purged.

(*)

Purges the VTAM shared memory information for all partners of this Db2 subsystem. This command option should only be used if you are planning to remove this Db2 subsystem from the Db2 group.

Usage notes

The following conditions must be satisfied for the RESET GENERICLU command to be successful:

- DDF must be started.

- No VTAM sessions can be active to the partner LU that is specified on the command.
- Db2 must not have any indoubt thread resolution information associated with the specified partner LU.

Examples

Example 1: Purge the VTAM generic name mapping that is associated with partner NET1.USER5LU.

```
-DB2A RESET GENERICLU(NET1.USER5LU)
```

Example 2: Purge the VTAM generic name mappings for all LUs that are partners of this Db2 subsystem. Use this version of the command only when removing this Db2 subsystem from the data sharing group.

```
-DB2A RESET GENERICLU(*)
```

Chapter 64. -RESET INDOUBT (Db2)

The Db2 command RESET INDOUBT purges the information that is displayed in the indoubt thread report that is generated by the DISPLAY THREAD command.

When the DISPLAY THREAD TYPE(INDOUBT) command output shows a RESET value of YES, use the RESET INDOUBT command without the FORCE option to purge indoubt thread information for threads in the following situations:

- Threads in which the Db2 database manager has a coordinator role that it cannot fulfill because of participant cold start, sync point protocol errors, or indoubt resolution protocol errors.
- Threads that were indoubt but were resolved with the RECOVER INDOUBT command. Heuristic damage occurred during subsequent resynchronization with the coordinator.

When the DISPLAY THREAD TYPE(INDOUBT) command output shows a RESET value of null, use the RESET INDOUBT command with the FORCE option to purge indoubt thread information in the following situations:

- A Db2 database manager has a coordinator role. No errors occurred that preclude automatic resolution with the participants. Resynchronization with affected participants is not performed.
- A Db2 database manager has a participant role. No errors occurred that preclude automatic resolution with the coordinator. Resynchronization with the coordinator is not performed.

The DISPLAY THREAD TYPE(INDOUBT) command output must indicate a commit or abort decision before an entry can be purged.

Abbreviation: -RESET IND

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- RECOVER privilege
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

LUNAME(*luname* , ...)

Purges all qualifying indoubt information that pertains to the specified LUNAME.

luname

Is expressed as a one- to eight-character name. If you use more than one LUNAME, separate each name with a comma.

(*)

Purges indoubt information for all SNA locations.

FORCE

Forces the purging of coordinator and participant indoubt resolution responsibility even when no errors that preclude automatic resolution have been detected. FORCE can be used in conjunction with IPADDR or LUNAME.

Purging resynchronization information when no errors that preclude automatic resynchronization have been detected simulates a cold start. Thus, no connections can exist between Db2 and the named partner when this command is executed. After you run the FORCE option, the next connection with the named partner location will be a cold start connection. If a connection with the named partner exists at the time this command is run, the command fails with message DSNL448I.

FORCE can be used to bypass warm start connectivity problems when errors that are occurring in the recovery log name exchange result in the partner refusing the connection attempt.

LOCATION(*location-name* , ...)

Purges all qualifying indoubt information that pertains to the named location.

location-name is expressed as a 1- to 39-character name, which identifies the partner, whether it is a requester or server. If the partner is not a Db2 for z/OS subsystem, the location name can be expressed as one of the following formats:

- A one- to eight-character luname, as defined to VTAM at the server location. This name must be enclosed in the less-than (<) and the greater-than (>) characters to distinguish it from a Db2 location name.
- A dotted decimal or colon hexadecimal IP address.

IPADDR(*ipaddr.port*)

Purges all qualifying indoubt information that pertains to the dotted decimal or colon hexadecimal IP address that is associated with the resync port number.

This keyword can be used in place of the LUNAME keyword when the partner uses TCP/IP instead of SNA.

ipaddr.port

Is the dotted decimal or colon hexadecimal IP address of the remote site, followed by the resync port number. The IP address and port must be delimited by a double period (.). If you use more than one IP address and port number, use commas to separate the items in the list.

(*)

Purges indoubt information for all TCP/IP locations.

LUWID

Purges indoubt information for the thread with the specified LUWID.

luwid

Consists of an LU network name, an LUW instance number, and a commit sequence number.

The LU network name consists of a 1- to 8-character network ID, a period, and a 1- to 8-character network LU name. The LUW instance number consists of a period followed by 12 hexadecimal characters. The last element of the LUWID is the commit sequence number, which consists of a period followed by four hexadecimal characters.

token

A token is an alternate way to express an LUWID. Db2 assigns a token to each thread that it creates. It is a one- to six-digit decimal number that appears after the equal sign in all Db2 messages that display an LUWID.

If you enter one- to six-decimal digits, Db2 assumes that you are supplying a token. The token that Db2 assigns to a specific LUWID is unique for that Db2 subsystem, but it is not necessarily unique across all subsystems.

Output

The response from this command includes any of the messages from DSNL440I through DSNL449I.

If you specify RESET INDOUBT incorrectly, you receive message DSNL440I.

Usage notes

Purging participant indoubt information: Use caution when you specify the FORCE option to purge participant indoubt information. Normally, after the use of the RECOVER INDOUBT command, automatic resolution with the coordinator determines if heuristic damage has occurred. This detection is lost if RESET INDOUBT is used before automatic resolution with the coordinator can be achieved.

Purging coordinator indoubt information: Use caution when you specify the FORCE option to purge coordinator indoubt information when no errors are precluding automatic resolution. When the information is purged, any participant that is indoubt is forced to use a heuristic decision process to resolve the indoubt logical unit of work.

Example

The following command resets an indoubt unit of work by specifying an IP address:

```
RESET INDOUBT IPADDR(: :FFFF:10.97.217.50..1332)
```

Chapter 65. RUN (DSN)

The DSN subcommand RUN executes an application program, which can contain SQL statements.

Environment

This subcommand can be issued under the DSN command processor running in either foreground or background mode, or it can be issued by using the DB2I RUN panel.

Data sharing scope: Member

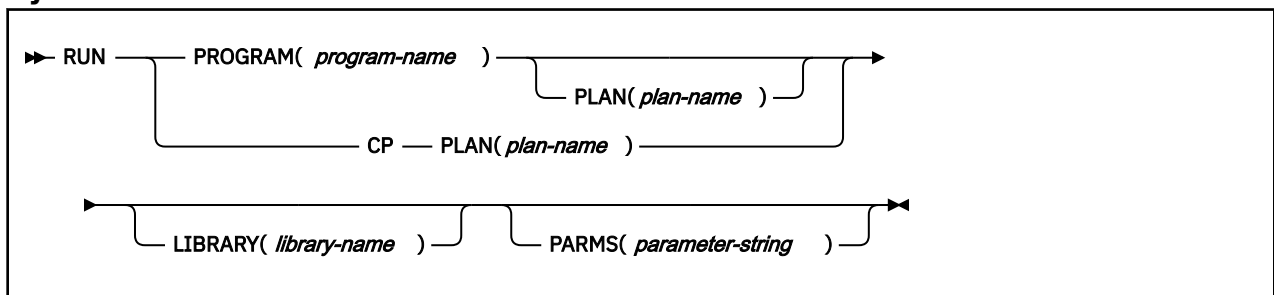

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- EXECUTE privilege on the plan
- Ownership of the plan
- SYSADM authority

To run an application, the plan must be enabled for your local server. Any associated packages from which you execute statements must also be enabled.

Syntax

Option descriptions

Use at least one of the two following clauses, but do not use the same clause twice.

PROGRAM (*program-name*)

Identifies the program that you want to run.

CP

Directs input to the user's command processor, and causes a prompt to be issued: ENTER TSO COMMAND. This is useful for running command processors and debugging programs (for example, COBTEST).

Processing the specified TSO command creates a new task control structure under which the TSO command executes. All application programs that are initiated from this TSO command session also execute under the same task structure, and must establish a new connection to Db2 if they use SQL requests.

When the TSO command completes, the new task structure is terminated, and control is returned to the original Db2 connection and task structure established by the DSN command.

Later TSO commands can be issued directly from the DSN session, or through the RUN subcommand with the CP option.

PLAN(*plan-name*)

Is optional after the PROGRAM option, but required after the CP option.

plan-name is the name of the application plan for the program.

When PROGRAM is used, the **default** plan name is *program-name*.

LIBRARY(*library-name*)

Specifies the name of the data set that contains the program to be run.

If *library-name* is not specified, normal z/OS library searching is used. The data sets that are specified in the STEPLIB DD statements are first searched for the entry point name of the program. If STEPLIB is not present, the data sets that are specified in the JOBLIB DD statements are searched. If the entry point name is not found there, the link list is searched.

Subprograms: Normal z/OS library searching is **always** used for any subprograms that is loaded by the main program. If the subprograms reside in the same library as the main program, the library-name must also be defined for the normal z/OS search pattern (STEPLIB, JOBLIB, link list). If a library that is defined in that way contains both the main program and any loaded subprograms, you do not need to use the LIBRARY option.

PARMS(*parameter-string*)

parameter-string is a list of parameters that are to be passed to your application program. Separate items in the list with commas, blanks, or both, and enclose the list between apostrophes. If the list contains apostrophes, represent each apostrophe by using two consecutive apostrophes. The list is passed as a varying-length character string of 1 to 100 decimal characters.

For Assembler: Use a list of the form 'program parameters'. There are no run time parameters.

No run time or application parameter validation is performed by the RUN subcommand on the *parameter-string* that is passed to your application program. All specified parameter values are assumed to adhere to the parameter syntax and format criteria defined by the language in which the application program is written.

For C: Use a list of the form A/B, where A represents a list of run time options, and B represents a list of parameters for the C application program. If run time options are not needed, write the list in the form /B. If the NOEXECOPS run time option is in effect, omit the "/".

For COBOL: If Language Environment is not the run time environment, use a list of the form B/A, where B represents a list of parameters for the COBOL application program, and A represents a list of run time options. If program parameters are not needed, write the list in the form of /A.

If Language Environment is the run time environment, use a list of the form A/B, where A represents a list of run time options, and B represents a list of parameters for the COBOL application program. If run time options are not needed, write the list in the form of /B. For compatibility, Language Environment provides the CBLOPTS run time option. When CBLOPT(YES) is specified in CEEDOPT or CEEUOPT and the main routine is COBOL, specify the list in the form of B/A, the same form as when the run time environment is not Language Environment. CBLOPT(NO) is the default.

For Fortran: Use a list of the form A/B, where A represents a list of Fortran run time options and B represents a list of parameters for the Fortran application program. If Fortran run time options are not needed, write the list in the form of B or /B. The second form must be used if a slash is present within the program arguments. If only Fortran run time options are present, write the list in the form of A/.

For PL/I: Use a list of the form A/B, where A represents a list of run time options, and B represents a list of parameters for the PL/I application program. If run time options are not needed, write the list in the form /B. If the PL/I NOEXECOPS procedure option is specified, omit the "/". An informational system message is issued if you omit the slash, or if the value that is passed to the PL/I run time package is not valid.

Usage note

Multitasking restriction: When running a program that uses a multitasking environment, the first task to issue an SQL statement must issue all subsequent SQL calls. That is, only one task in a multitasking environment can issue SQL calls. This task must be a subtask of, or running at the same TCB level as, the DSN main program.

Examples

Example 1: Run application program DSN8BC4. The application plan has the same name. The program is in library '*prefix*.RUNLIB.LOAD'.

```
DSN SYSTEM (DSN)
RUN PROGRAM (DSN8BC4) LIB ('
prefix
.RUNLIB.LOAD')
```

Example 2: Run application program DSN8BP4. The application plan is DSN8BE81. The program is in library '*prefix*.RUNLIB.LOAD'. Pass the parameter O'TOOLE to the PL/I application program with no PL/I run time options. Because O'TOOLE contains an apostrophe, you need to double that apostrophe in the PARMs parameter value.

```
DSN SYSTEM (DSN)
RUN PROGRAM (DSN8BP4) PLAN (DSN8BE81) -
LIB ('prefix.RUNLIB.LOAD') PARMs ('/O''TOOLE')
```

Chapter 66. -SET ARCHIVE (Db2)

The Db2 command SET ARCHIVE sets the maximum number of tape units for the archive log. It also sets the maximum deallocation time of tape units for the archive log.

This command overrides the values that are specified during installation or in a previous invocation of the SET ARCHIVE command. The changes that SET ARCHIVE makes are temporary; at restart, Db2 again uses the values that are set during installation.

Abbreviation: -SET ARC

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

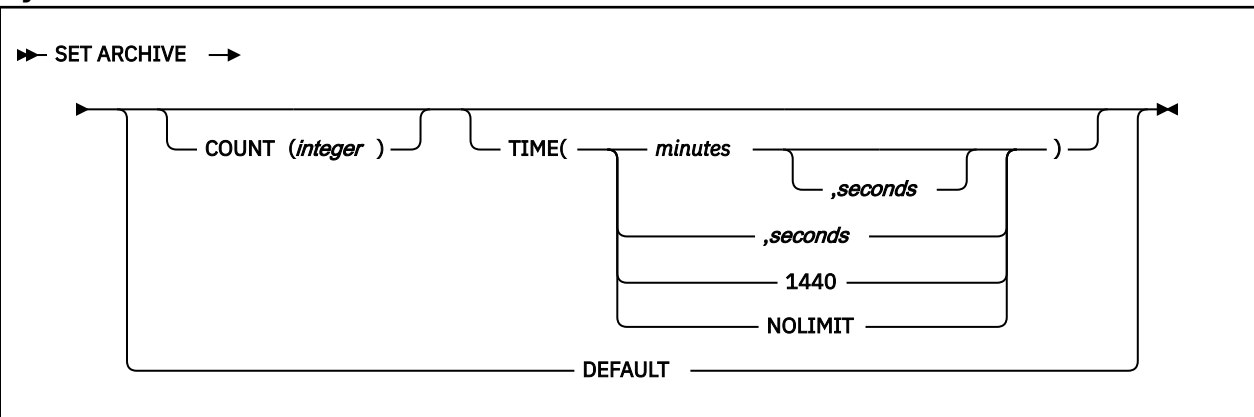

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- ARCHIVE privilege
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

The following options override the READ TAPE UNITS(COUNT) and DEALLC PERIOD TIME subsystem parameters that are specified during installation.

COUNT(integer)

Specifies the maximum number of tape units that can be dedicated to reading archive logs. This value affects the number of concurrent reads that are allowed for unique archive data sets that reside on tapes.

integer can range 1 - 99.

- If the number that you specify is greater than the current specification, the maximum number of tape units allowable for reading archive logs increases.
- If the number that you specify is less than the current specification, tape units that are not being used are immediately deallocated to adjust to the new COUNT value. Active (or premounted) tape units remain allocated; only tape units that are inactive are candidates for deallocation because of a lowered COUNT value.

TIME

Specifies the length of time during which an allocated archive read tape unit is allowed to remain unused before it is deallocated.

(*minutes*)

Specifies the maximum number of minutes.

minutes must be an integer between 0 and 1439.

(*seconds*)

Specifies the maximum number of seconds.

seconds must be an integer between 1 and 59.

(NOLIMIT) or (1440)

Indicates that the tape unit will never be deallocated. Specifying TIME(1440) is equivalent to TIME(NOLIMIT). The seconds specification is not allowed when you specify that TIME is 1440.

DEFAULT

Resets the COUNT and TIME parameters back to the values that were specified during Db2 installation.

Usage notes

Archive tape reading performance: To achieve the best performance for reading archive tapes, specify the maximum values that are allowed (within system constraints) for both the COUNT and TIME options.

IEF238D "REPLY DEVICE NAME OR CANCEL" message: Replying "CANCEL" to this message resets the COUNT value to the current number of tape units. For example, if the current COUNT value is 10, but you reply "CANCEL" to the request for the seventh tape unit, the COUNT value is reset to 6.

Delaying tape deallocation in a data sharing environment: When you submit a recover job on a member of a data sharing group that requires a tape unit that must remain unused for a certain length of time before it is deallocated, the archive tape is not available to any other member of the group until the tape is deallocated. Unless all recover jobs will be submitted from the same member, you might not want to use the COUNT option and ensure that field DEALLOC PERIOD on installation panel DSNTIPA has a value of 0.

Output

The response from this command includes any of the messages from DSNJ334I through DSNJ337I.

Examples

Example 1: Allocate two tape units that can remain unused for 30 seconds before they are deallocated.

```
-SET ARCHIVE COUNT(2) TIME(,30)
```

Example 2: Allocate four tape units that can remain unused for 2 minutes before they are deallocated.

```
-SET ARCHIVE COUNT(4) TIME(2)
```

Example 3: Allocate one tape unit that is never deallocated.

```
-SET ARCHIVE COUNT(1) TIME(1440)
```

Chapter 67. -SET LOG (Db2)

The Db2 command SET LOG modifies the checkpoint frequency that is specified during installation. This command also overrides the value that was specified in a previous invocation of the SET LOG command.

The changes that SET LOG makes are temporary; at restart, Db2 uses the values that were used for restart. The LOGLOAD value takes effect following the next system checkpoint. You can use SET LOG to suspend or resume logging and update activity for the current Db2 subsystem. You can also use the NEW LOG option of SET LOG to add an active log to the configuration. Changes made by NEW LOG are pervasive.

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program that uses the instrumentation facility interface (IFI).

Data sharing scope: Member

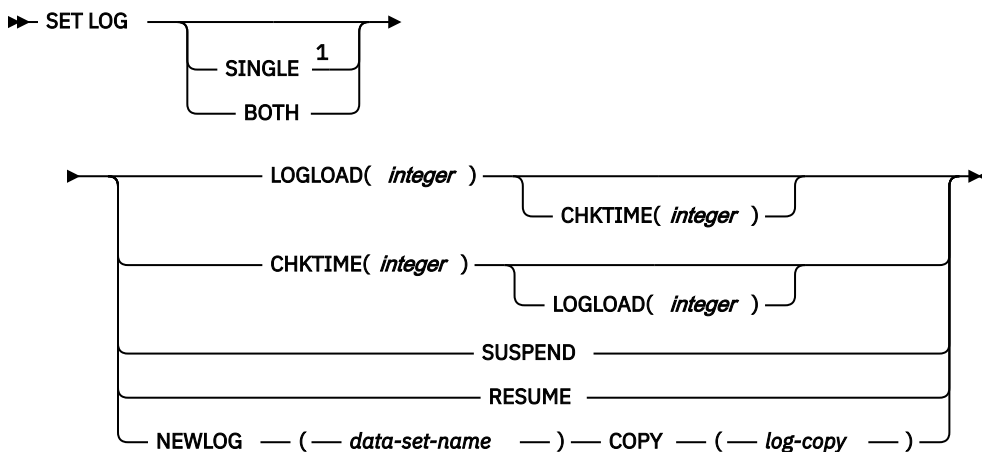

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- ARCHIVE privilege
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Notes:

¹ If you specify SINGLE, you must also specify LOGLOAD or CHKTIME.

Option descriptions

The following option overrides the LOGLOAD subsystem parameter that is specified in the CHECKPOINT FREQ field on installation panel DSNTIPN.

SINGLE

Specifies that only a single option, either LOGLOAD or CHKTIME, is used to control checkpoint frequency. If you specify SINGLE, you must specify LOGLOAD or CHKTIME.

SINGLE is optional. If you do not use this option, the existing mode, SINGLE or BOTH, is used. If you specify SINGLE but BOTH was previously in effect, the mode changes to SINGLE.

BOTH

Specifies that both LOGLOAD and CHKTIME are used control checkpoint frequency. The threshold that is reached first triggers a system checkpoint and resets both thresholds.

BOTH is optional. If you do not use this option, the existing mode, SINGLE or BOTH, is used. If you specify BOTH but SINGLE was previously in effect, the mode changes to BOTH and the input values for LOGLOAD and CHKTIME are used. If you do not specify LOGLOAD or CHKTIME, the existing value for the option not specified remains in effect. If the value for CHKTIME or LOGLOAD has not been set and the option is not specified in the SET LOG command, the default value for the parameter that is not specified is used.

If a SET LOG command changes SINGLE mode to BOTH, and that command does not specify CHKTIME, the default value for CHKTIME is 3 minutes.

LOGLOAD (integer)

Specifies the number of log records that Db2 writes between the start of successive checkpoints. You can specify a value of 0 to initiate a system checkpoint without modifying the current LOGLOAD value.

Possible values of *integer* are:

- 1000 to 16000000, if SINGLE is explicitly specified in the SET LOG command
- 0, or 1000 to 16000000, if SINGLE mode is in effect
- 0, or 1000 to 99999999, if BOTH is explicitly specified in the SET LOG command, or BOTH mode is in effect

The default value for LOGLOAD is 500000 log records.

If Db2 was previously running in SINGLE mode, CHKTIME was previously controlling checkpoints, and you specify a value greater than 0 for LOGLOAD, LOGLOAD controls future checkpoints, and CHKTIME is not used.

CHKTIME (integer)

Specifies the number of minutes between the start of successive checkpoints.

integer is any integer from 0 to 5. Specifying 0 starts a system checkpoint immediately without modifying the checkpoint frequency.

Possible values of *integer* are:

- 1 to 5, if SINGLE is explicitly specified in the SET LOG command
- 0 to 5, if SINGLE mode is in effect
- 0 to 5, if BOTH is explicitly specified in the SET LOG command, or BOTH mode is in effect

If Db2 was previously running in SINGLE mode, LOGLOAD was previously controlling checkpoints, and you specify a value greater than 0 for CHKTIME, CHKTIME controls future checkpoints, and LOGLOAD is not used.

SUSPEND

Specify to suspend logging and update activity for the current Db2 subsystem until SET LOG RESUME is issued. Db2 externalizes unwritten log buffers, takes a system checkpoint (in non-data-sharing environments), updates the BSDS with the high-written RBA, and then suspends the update activity. Message DSNJ372I is issued and remains on the console until update activity resumes.

SUSPEND quiesces the writes for 32-KB pages and the data set extensions for all page sizes. If a 32-KB page write is in progress when you take volume-level copies of your data, SUSPEND prevents an inconsistent copy of a 32-KB page when the copy of your data is restored. If a data set extension is in progress, SUSPEND prevents inconsistencies between the VSAM catalog and the Db2 data set when the copy of your data is restored.

This option is not allowed when the ARCHIVE LOG or STOP DB2 commands activate a system quiesce. Update activity remains suspended until SET LOG RESUME or STOP DB2 is issued. (Also, when logging is suspended, do not issue the ARCHIVE LOG command without also specifying CANCEL OFFLOAD.)

Recommendation: Do not keep log activity suspended during periods of high activity or for long periods of time. Suspending update activity can cause timing-related events such as lock timeouts or Db2 and IRLM diagnostic dumps.

RESUME

Specify to resume logging and update activity for the current Db2 subsystem and to remove the message DSNJ372I from the console. Resumes 32-KB page writes and data set extensions for pages of all sizes.

Recommendation: Issue this command from a z/OS console or from the installation SYSADM ID to avoid possible contention during command authorization checking. When logging is suspended by the SET LOG SUSPEND command, the contention that is generated by holding the log-write latch can cause command-authorization checking to hang until logging resumes.

NEWLOG (*data set name*)

Adds a newly defined active log data set to the active log inventory. If Db2 can open the newly defined data set, the log is added to the active log inventory in the BSDS data sets and is immediately available for use without recycling Db2.

Before you issue this command, you must define the data set with IDCAMS.

Important: Ensure that each archive log data set is at least as large as your active log data sets. See [Active log data sets storage requirements \(Db2 Installation and Migration\)](#) for more information about requirements for active log data sets. Before you can add an active log data set that is greater than 4 GB, you must also activate function level 500 or higher.

Recommendation: Format the new active log data set with the DSNJLOGF utility before you issue the SET LOG command to add the data set to the active log inventory.

COPY (*log copy*)

Specifies the log copy number for the new active log data set.

The value of *log copy* can be 1 or 2. Specify 1 for copy 1 of the active log data set or 2 for copy 2 of the active log data set.

Recommendation: If Db2 is in dual logging mode, add log data sets for both copy 1 and copy 2 of the new active log data set.

Usage notes

How LOGLOAD and CHKTIME values affect Db2 performance: LOGLOAD and CHKTIME values can affect the amount of time needed to restart Db2 after abnormal termination. A large value for either option can result in lengthy restart times. A low value can result in Db2 taking excessive checkpoints. However, when you specify LOGLOAD(0) or CHKTIME(0), the checkpoint request is synchronous when issued from a batch job, and it is asynchronous when issued from a z/OS or TSO console.

The behavior of LOGLOAD(0) and CHKTIME(0) is different in a data sharing environment. Avoid issuing SET LOG LOGLOAD(0) or SET LOG CHKTIME(0) in the data sharing environment if logging has been suspended with SET LOG SUSPEND on any member in the group. If you specify LOGLOAD(0) or CHKTIME(0), the synchronous checkpoint might be suspended until all logging has been resumed when you issue the SET LOG RESUME command.

Use the DISPLAY LOG command to display the current checkpoint parameters. You can see if CHKTIME, LOGLOAD, or both are being used to schedule checkpoints.

The value that you specify for LOGLOAD or CHKTIME is reset to the value specified in the subsystem parameter when Db2 is restarted. If you load a different value by issuing the command SET SYSPARM, the new value is used.

When to suspend logging: Specify SET LOG SUSPEND before making a remote copy of the entire database and logs for a system-level, point-in-time recovery or disaster recovery. You can make remote copies with peer-to-peer remote recovery (PPRC) and FlashCopy®. Suspending logging to make a remote copy of the database lets you avoid quiescing update activity. Read-only activity continues while logging is suspended.

The backup that is made between the SET LOG SUSPEND and the SET LOG RESUME window might contain uncommitted data. If you must restore the entire Db2 subsystem to the time when the log was suspended, restore the entire database and logs from the backup, and then restart Db2 to recover the entire Db2 subsystem to a consistent state.

Avoiding deadlocks when using SET LOG SUSPEND in a data sharing environment: To avoid deadlock in a data sharing environment, issue the SET LOG SUSPEND command on one data sharing member first, wait until it completes, and then issue the command for the remaining members.

Order in which newly defined active log data sets are used: Currently, if you do not stop and start Db2 during the period after you add new active log data sets to the inventory and before Db2 uses those active log data sets, Db2 uses the active log data sets in the reverse order from the order in which you add them to the active log inventory with the SET LOG command. For example, suppose that the active log inventory contains data sets DS01, DS02, and DS03, and you add data set DS04 and then data set DS05. If data set DS03 is active, and you issue the ARCHIVE LOG command, the new active log becomes DS05. However, if you stop and start Db2 during the period after you add new active log data sets and before Db2 uses them, the order of use might be different.

This behavior might change in the future, so schemes for adding and switching active logs should not depend on this order.

This process differs from the order that the database manager uses when data sets are added to the active log inventory through the DSNJU003 utility (change log inventory utility). After the NEWLOG control statement is used to add new data sets, the database manager uses active log data sets in the order in which they are added.

Suppose that the active log inventory contains DS01, DS02, and DS03. You run DSNJU003 with two NEWLOG control statements. The first control statement adds data set DS04, and the second control statement adds data set DS05 to the active log inventory. After DSNJU003 runs, the data sets are listed in the BSDS in the order DS01, DS02, DS03, DS04, DS05. When the current active log data set is DS03, and the database manager switches to a new active log data set, it switches to data set DS04.

Examples

Example 1: Initiate a system checkpoint without modifying the current LOGLOAD value.

```
-SET LOG LOGLOAD(0)
```

Example 2: Modify the system checkpoint interval to every 150000 log records.

```
-SET LOG LOGLOAD(150000)
```

Example 3: Suspend logging activity.

```
-SET LOG SUSPEND
```

Example 4: Resume logging activity.

```
-SET LOG RESUME
```

Example 5: Change checkpoint scheduling to use both log records and time.

```
-SET LOG BOTH CHKTIME(10) LOGLOAD(500000)
```

Example 6: Change checkpoint scheduling to use only log records.

```
-SET LOG SINGLE LOGLOAD(500000)
```

Example 7: Change checkpoint scheduling to use both log records and time by using the existing value for the parameter that was controlling checkpoints and the default value for the other.

```
-SET LOG BOTH
```

Example 8: Add copies of a new active log data set to the active log inventory (Db2 is in dual logging mode).

```
//JOB LIB DD DSN=prefix.SDSNLOAD,DISP=SHR
//NEWLOG EXEC PGM=IKJEFT01,DYNAMNBR=20
//DSNTRACE DD SYSOUT=*
//SYSTSPRT DD SYSOUT=*
//SYSPRINT DD SYSOUT=*
//SYSABEND DD SYSOUT=*
//SYSTSIN DD *
DSN SYSTEM(DSN1)
-SET LOG NEWLOG(DSNCAT.LOGCOPY1.DS04) COPY(1)
-SET LOG NEWLOG(DSNCAT.LOGCOPY1.DS05) COPY(1)
-SET LOG NEWLOG(DSNCAT.LOGCOPY1.DS06) COPY(1)
-SET LOG NEWLOG(DSNCAT.LOGCOPY1.DS07) COPY(1)
-SET LOG NEWLOG(DSNCAT.LOGCOPY2.DS04) COPY(2)
-SET LOG NEWLOG(DSNCAT.LOGCOPY2.DS05) COPY(2)
-SET LOG NEWLOG(DSNCAT.LOGCOPY2.DS06) COPY(2)
-SET LOG NEWLOG(DSNCAT.LOGCOPY2.DS07) COPY(2)
END
/*
//SYSIN DD *
/*
```

The following messages are issued:

```
DSNJ363I ) DSNJW106 COPY1 LOG DATA SET
DSNCAT.LOGCOPY1.DS04 ADDED TO THE ACTIVE LOG INVENTORY
DSNJ363I ) DSNJW106 COPY1 LOG DATA SET
DSNCAT.LOGCOPY1.DS05 ADDED TO THE ACTIVE LOG INVENTORY
DSNJ363I ) DSNJW106 COPY1 LOG DATA SET
DSNCAT.LOGCOPY1.DS06 ADDED TO THE ACTIVE LOG INVENTORY
DSNJ363I ) DSNJW106 COPY1 LOG DATA SET
DSNCAT.LOGCOPY1.DS07 ADDED TO THE ACTIVE LOG INVENTORY
DSNJ363I ) DSNJW106 COPY2 LOG DATA SET

Related reference

“-ACTIVATE (Db2)” on page 23

The Db2 command ACTIVATE enables use of new capabilities and enhancements at the specified function level, and lower function levels. Use of the ACTIVATE command to activate function level 500 or higher also marks the boundary between the ability to coexist with or fallback to Db2 11.

Chapter 68. -SET SYSPARM (Db2)

You can use the SET SYSPARM command to change subsystem parameters that can be updated online, while Db2 is started.

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program that uses the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority
- SECADM authority

To change the following subsystem parameters, you must use a privilege set of the process that includes installation SYSADM authority or SECADM authority:

- AUTHCACH
- BINDNV
- DBACRVW
- EXTSEC
- REVOKE_DEP_PRIVILEGES
- SECADM1
- SECADM1_TYPE
- SECADM2
- SECADM2_TYPE
- SEPARATE_SECURITY
- SYSADM
- SYSADM2
- SYSOPR1
- SYSOPR2
- TCPALVER

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

LOAD(*load-module-name*)

Specifies the name of the load module to load into storage. The default load module is **DSNZPARM**.

RELOAD

Reloads the last named subsystem parameter load module into storage.

STARTUP

Resets loaded parameters to their startup values.

Usage notes

To update the subsystem parameters on a subsystem, follow these steps:

1. Run through the installation process in Update mode.
2. Produce a new subsystem parameter load module.
3. Issue the SET SYSPARM command.

Important:

- Do not issue SET SYSPARM while you are compressing the data set that contains the new subsystem parameter load module.
- If you are compressing the data set that contains the new subsystem parameter load module, and the data set resides in the system LLA, after you compress the data set, and before you issue SET SYSPARM, issue command F LLA, REFRESH. Wait for message CSV210I, which indicates that F LLA, REFRESH is complete.

If you attempt to change installation SYSADM or installation SYSOPR subsystem parameters and you do not have the proper authority, the parameter values that are in place prior to the load of the new subsystem-parameter module are used instead of the unauthorized values in the new module. Db2 issues message DSNZ015 for each attempt of an unauthorized change to a subsystem parameter.

Examples

Example 1: Change from DSNZPARM to ADMPARM1.

```
-SET SYSPARM LOAD(ADMPARM1)
```

Example 2: Reload ADMPARM1 if it is the currently running load module.

```
-SET SYSPARM RELOAD
```

Example 3: Reload the subsystem parameters that the Db2 subsystem loaded at startup.

```
-SET SYSPARM STARTUP
```

Chapter 69. SPUFI (DSN)

The DSN subcommand SPUFI executes the SQL processor using file input.

Environment

You can use this subcommand only under ISPF. You can issue it from ISPF option 6, or from a CLIST.

Data sharing scope: Member

Authorization

None is required.

Syntax

» SPUFI «

Usage notes

SPUFI session: The SPUFI subcommand runs SPUFI and presents the SPUFI panel as the start of a SPUFI session.

In the SPUFI session, you can access the CURRENT SPUFI DEFAULTS panel. You can change DB2I defaults by splitting the screen and accessing the DB2I DEFAULTS panel, or by changing the defaults before starting the SPUFI session.

SPUFI panel variables: The SPUFI panel variables you enter after invoking SPUFI directly with the DSN command are not saved in the same place. Panel variables, therefore, vary depending on whether you execute the facility directly, or through DB2I.

Chapter 70. -START ACCEL (Db2)

The Db2 command START ACCEL notifies the Db2 subsystem that it should use the specified accelerator servers.

Abbreviation: -STA ACCEL

On successful completion of the command, queries for the specified accelerator servers can begin to run. Db2 resets trace statistics to 0 each time that you execute the START ACCEL command.

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program that uses the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the SCOPE option.

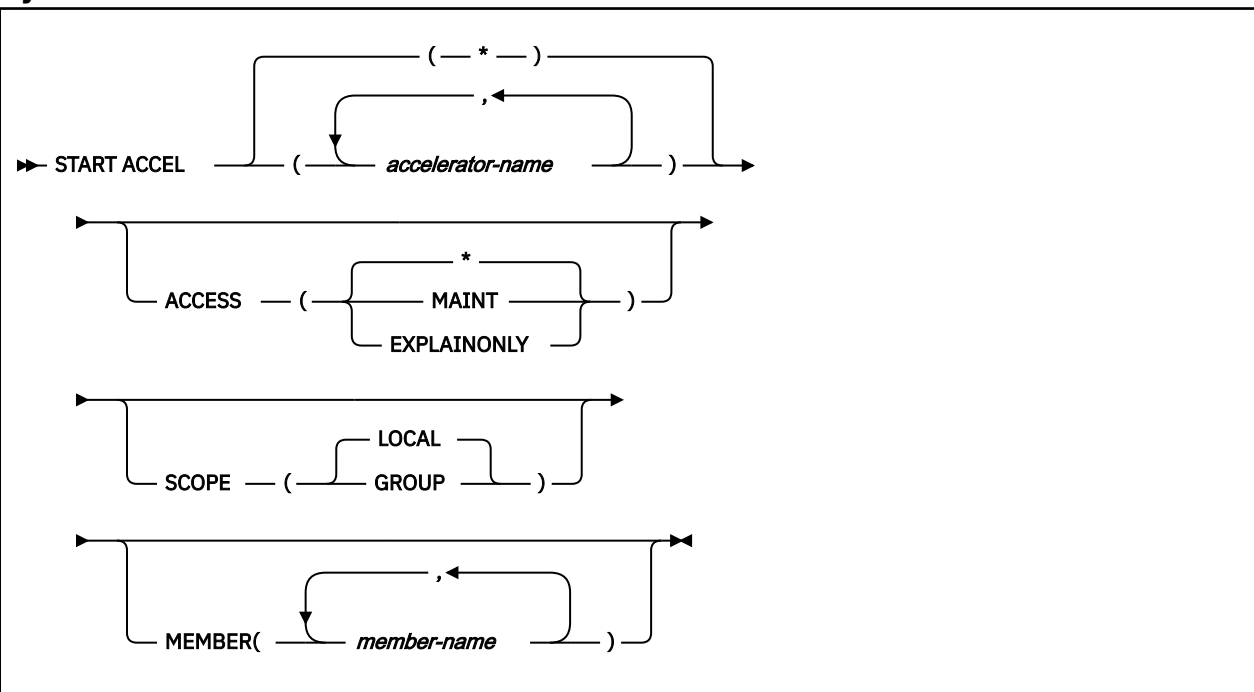

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization by using primary and secondary authorization IDs.

Syntax

Option descriptions

(*accelerator-name*)

The accelerator server name.

(*)

Indicates that the start command applies to all accelerator servers.

ACCESS

Specifies whether access to accelerator servers is general or restricted. Valid values are:

(*)

Allows general access; all authorized users can use the accelerator server.

(MAINT)

Allows only installation SYSADM and installation SYSOPR access to the accelerator server.

(EXPLAINONLY)

Prohibits use of the accelerator server except for SQL EXPLAIN execution. No queries will be executed by this server.

SCOPE

Specifies the scope of the command. In a non-data-sharing environment, the option is ignored. Valid values are:

(LOCAL)

Starts the accelerator server for the current member.

(GROUP)

Starts accelerator servers for the entire data sharing group.

MEMBER

Restricts the start of the identified accelerator server to specific members of the data sharing group. The default behavior is to start accelerator servers on the local member. This option is not supported in non-data sharing environments.

Usage notes

You must issue START ACCEL when you add a new accelerator server to the SYSACCELERATORS pseudo-catalog table, or when you have modified the information in this table and issued the -STOP ACCEL command.

If both SCOPE(GLOBAL) and MEMBER(*member-name*) are specified, the command will be executed only on the specified member or members.

You can monitor the status of a started accelerator server by running the -DISPLAY ACCEL command.

Example

The following command starts all accelerator servers.

```
-START ACCEL
```

Sample results:

```
DSNX820I ) DSNX8STA START ACCELERATOR SUCCESSFUL FOR BLINK1
DSNX820I ) DSNX8STA START ACCELERATOR SUCCESSFUL FOR BLINK2
DSNX820I ) DSNX8STA START ACCELERATOR SUCCESSFUL FOR BLINK3
DSNX821I ) DSNX8STA ALL ACCELERATORS STARTED
DSN9022I ) DSNX8CMD '-START ACCEL' NORMAL COMPLETION
```

[Enabling Db2 for IBM Db2 Analytics Accelerator for z/OS \(Db2 Performance\)](#)

Related information

[IBM Db2 Analytics Accelerator for z/OS documentation](#)

Chapter 71. START admtproc

The START *admtproc* command starts the scheduler that is specified in the *admtproc* parameter.

This command can be started at the operator's console, or during Db2 startup or initialization. Once started, the administrative task scheduler is always up, unless it is stopped by a STOP command at the operator's console.

Each Db2 subsystem has a coordinated administrative task scheduler address space for starting a z/OS started task procedure, therefore if there are many Db2 subsystems running on one z/OS, there is a separate administrative task scheduler with a separate name for each. Two instances of the same administrative task scheduler cannot run simultaneously. To avoid starting up a duplicate administrative task scheduler, at startup the administrative task scheduler checks all of the address spaces for duplicate names. If another address space with the same name is already running, the administrative task scheduler that is starting up will immediately shut down with a console error message. The administrative task scheduler can only check the address spaces in the same system, but not the entire Sysplex.

Environment

This command can be issued only from a z/OS console.

Data sharing scope: Member

Authorization

The command requires an appropriate level of operating system authority.

Syntax

Options must be separated by commas, with no spaces.

Option descriptions

admtproc

Specifies the procedure name of the administrative task scheduler task that you want to start.

trace

Traces can be turned on or off using this option.

Examples

Example: This command starts the *admtproc* scheduler.

Enter the following command on the system console:

```
start admtproc
```

Chapter 72. -START CDDS (Db2)

The Db2 command START CDDS directs all members of a Db2 data sharing group to allocate and open the compression dictionary data set (CDDS).

Abbreviation: -STA CDDS

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program that uses the instrumentation facility interface (IFI).

This command must be issued from the source or proxy data sharing group in an implementation of the GDPS Continuous Availability with zero data loss solution.

Data sharing scope: Group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- BSDS privilege
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

►► START CDDS ◄◄

Examples

Example: Allocating and opening the CDDS on all members of a source data sharing group

Issue this command:

```
-START CDDS
```

If the command is successful, output like this is displayed:

```
DSNJ375I - DSNJB101 CDDS DSNAME = cdds-name IS ACTIVE IN SOURCE  
MODE.
```

```
DSN9022I - DSNJC001 'START CDDS' NORMAL COMPLETION
```

Related tasks

Recovering the compression dictionary data set without bringing down a Db2 data sharing group ([Db2 Administration Guide](#))

Chapter 73. -START DATABASE (Db2)

The **START DATABASE** command makes the specified database available for use.

Depending on which options you specify, the following objects can be made available for read-only processing, read-write processing, or utility-only processing:

- Databases
- Table spaces
- Index spaces
- Physical partitions of partitioned table spaces or index spaces (including index spaces housing data-partitioned secondary indexes (DPSIs))
- Logical partitions of nonpartitioned secondary indexes.

The command is typically used after one of the following events:

- The STOP DATABASE command is issued
- A table space, partition, or index is placed in group buffer pool RECOVER-pending status (GRECP)
- Pages have been put on the logical page list (LPL) for a table space, partition, or index

In a data sharing environment, the command can be issued from any Db2 subsystem in the group that has access to the specified database.

Abbreviation: -STA DB

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (Db2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- STARTDB privilege
- DBMAINT authority
- DBCTRL authority
- DBADM authority
- System DBADM authority
- SYSCTRL authority
- SYSADM authority

When you are using a privilege set that does not contain the STARTDB privilege for a specified database, Db2 issues an error message.

For implicitly created databases, the database privilege or authority can be held on the implicitly created database or on DSNCB04. If the START DATABASE command is issued on specific table spaces or index spaces in an implicitly created database, ownership of the table spaces is sufficient to start them. This means that the owner can display information about an implicitly created table space or index space if the command explicitly specifies that table space or index space name.

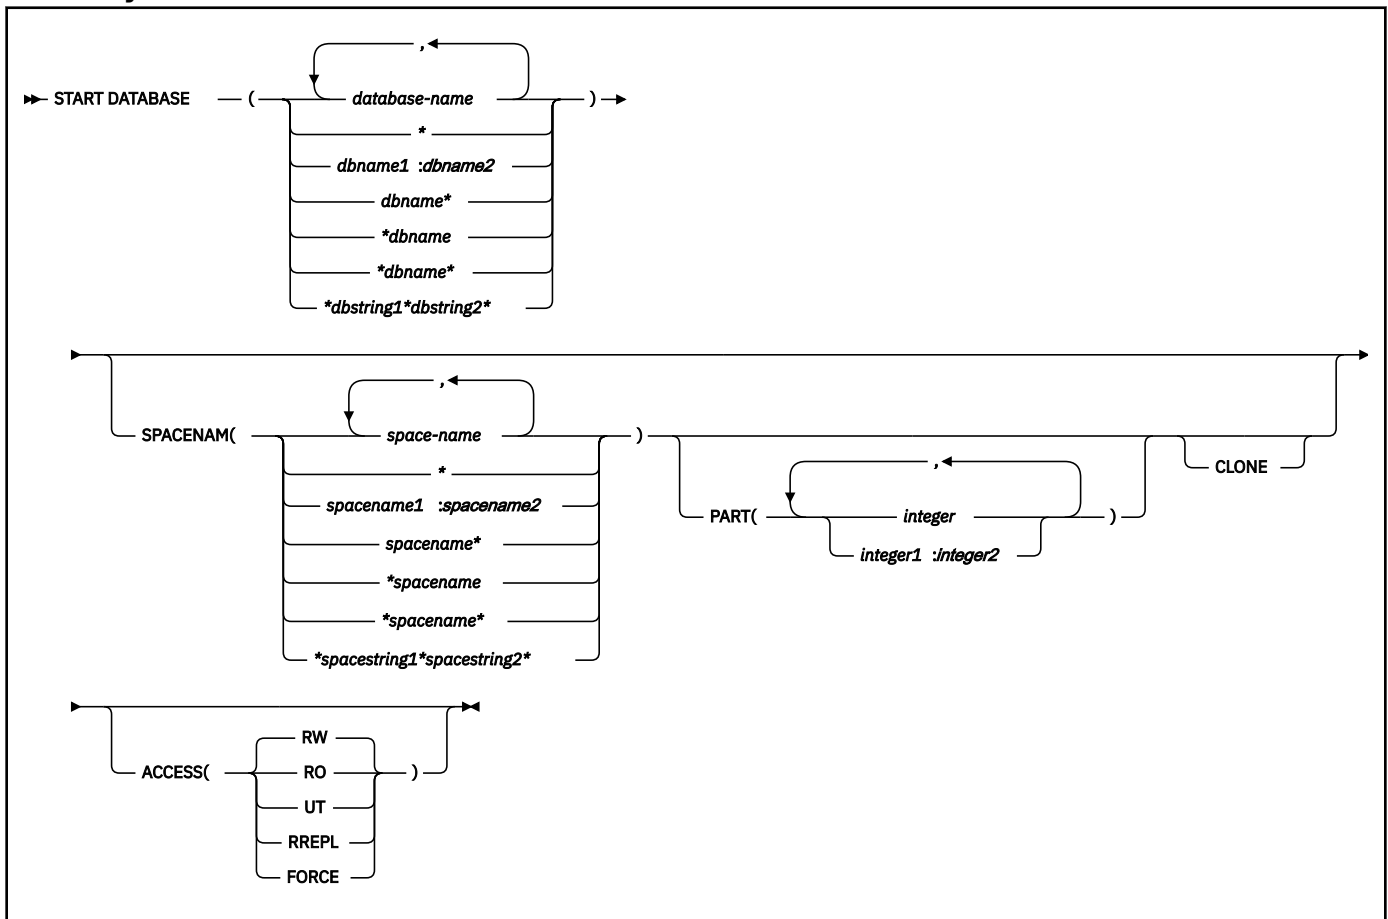

All specified databases with the STARTDB privilege included in the privilege set of the process are started.

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

When data definition control is active, installation SYSOPR or installation SYSADM authority is required to start a database, a table space, or an index space containing a registration table or index.

Table space DBD01 in database DSNDB01 and table spaces and index spaces in database DSNDB06 are required to check the authorization for using the START DATABASE command. If a table space or index space required for this authorization check is stopped, or is unavailable because it is in LPL or GRECP status, installation SYSADM authority is required to start any database, table space, or index space, including the ones required for the authorization check.

Syntax

Option descriptions

(*database-name* , ...)

Specifies the name of a database, or a database for the table spaces or index spaces that are to be started. The following variations are accepted:

(*database-name*, ...)

Identifies one or more database names, separated by commas or blanks.

(***)

All databases that are defined to the Db2 subsystem for which the privilege set of the process has the required authorization.

(*dbname1:dbname2*)

All databases whose names, in UNICODE, are between *dbname1* and *dbname2* inclusive.

(*dbname**)

All databases whose names begin with the string *dbname* that contains 1 - 7 characters.

(*dbname)

All databases whose names end with the string *dbname* that contains 1 - 7 characters.

(*dbname*)

All databases whose names contain the string *dbname*, where *dbname* that contains 1 - 6 characters.

(*dbstring1*dbstring2*)

All databases whose names contain the strings *dbstring1* and *dbstring2* that together contain a total of 2 - 5 characters.

SPACENAM

Specifies the particular table spaces or indexes within the database that are to be started. If you use ACCESS(FORCE), you must use SPACENAM with a list of table space and index names.

Abbreviation: SPACE, SP

(space-name , ...)

Specifies the name of a table space or index space that is to be started. You can use a list of several names of table spaces and index spaces.

(spacename, ...)

One or more index space names, separated by commas or blanks.

(*)

All table spaces or index spaces that are defined to the Db2 subsystem for which the privilege set of the process has the required authorization.

(spacename1:spacename2)

All table spaces or index spaces whose names, in UNICODE, are between *spacename1* and *spacename2* inclusive

(spacename*)

All table spaces or index spaces whose names begin with the string *spacename* that contains 1 - 7 characters.

(*spacename)

All table spaces or index spaces whose names end with the string *spacename* that contains 1 - 7 characters.

(*spacename*)

All table spaces or index spaces whose names contain the string *spacename* that contains 1 - 6 characters.

(*spacestring1*spacestring2*)

All table spaces or index spaces whose names contain the strings *spacestring1* and *spacestring2* that together contain a total of 2 - 5 characters.

PART (integer , ...)

Specifies the partition number of one or more partitions, within the specified table space or index, that are to be started. The start or stop state of other partitions does not change.

The specified *integer* must identify a valid partition number for the corresponding space name and database name. If you specify nonvalid partition numbers, you receive an error message for each nonvalid number, but all other valid partitions that you specified are started.

integer can be written to designate one of the following specifications:

- A list of one or more partitions
- A range of all partition numbers that are greater than or equal to *integer1* and less than or equal to *integer2*
- A combination of lists and ranges

The PART option is valid with partitioned table spaces, partitioned indexes, and nonpartitioned type 2 indexes of partitioned table spaces. If you specify PART with a nonpartitioned table space or index on a nonpartitioned table space, you receive an error message, and the nonpartitioned space is not started.

CLONE

Starts clone objects. In the absence of the CLONE keyword, base table objects are started and the clone table objects are not processed. If you specify the CLONE keyword then only clone objects are processed.

ACCESS

Specifies whether the objects that are started are in read/write, read only, or utility only status. Also forces access to objects that are in unavailable status.

Abbreviation: ACC

(RW)

Allows programs to read from and write to the specified databases, table spaces, indexes, or partitions.

(RO)

Allows programs to only read from the specified databases, table spaces, indexes, or partitions. Any programs attempting to write to the specified objects will not succeed. Do not use this option for a database for declared temporary tables (databases created with the AS TEMP option).

(UT)

Allows only Db2 online utilities and the SQL DROP statement to access the specified databases, table spaces, indexes, or partitions.

(RREPL)

Allows programs only read access to the specified databases, table spaces, indexes, or partitions, unless those programs were identified as replication programs. Attempts by non-replication programs to write to the specified objects fail. Most Db2 utilities are allowed on the specified objects.

Restriction: Do not use ACCESS(RREPL) for a database for declared temporary tables (a database that was created with the AS TEMP option).

(FORCE)

Resets any indications that a table space, index, or partition is unavailable because of pages in the logical page list, pending-deferred restarts, write-error ranges, read-only accesses, or utility controls. FORCE also resets the CHECK-pending, COPY-pending, and RECOVER-pending states. Full access to the data is forced. FORCE cannot be used to reset the restart-pending (RESTP) state.

When using ACCESS(FORCE), you must use a single database name, the SPACENAM option, and an explicit list of table space and index names. You cannot use any range or combination of pattern-matching characters (*), including DATABASE (*) or SPACENAM (*).

A utility-restrictive state is reset (and the utility is terminated) only if all of the target objects are reset with this command. To identify which objects are target objects of the utility, use the DISPLAY DATABASE command, or run the DIAGNOSE utility with the DISPLAY SYSUTIL option. The DIAGNOSE utility should be used only under the direction of IBM Software Support.

Note: ACCESS(FORCE) will not successfully complete if the object you are trying to force was placed in a utility-read-only (UTRO), utility-read-write (UTRW), or utility-utility (UTUT) state by a utility running in a previous release of Db2. If this situation is encountered, Db2 issues message DSNIO41I. To reset the restrictive state, you must terminate the utility using the release of Db2 in which it was started.

A table space or index space that is started with ACCESS(FORCE) might be in an inconsistent state.

Usage notes

Data sets offline: Disk packs that contain partitions, table spaces, or indexes, do not necessarily need to be online when a database is started. Packs must, however, be online when partitions, table spaces, or indexes are first referred to. If they are not online, an error in opening occurs.

Table spaces and indexes explicitly stopped: If table spaces and indexes are stopped explicitly (using the STOP DATABASE command with the SPACENAM option), they must be started explicitly. Starting the database does not start table spaces or indexes that have been explicitly stopped.

Effect on objects marked with GRECP or with LPL entries: If a table space, partition, or index is in the group buffer pool RECOVER pending (GRECP) status, or if it has pages in the logical page list (LPL), the START DATABASE command begins recovery of the object. You must specify the SPACENAM option and ACCESS (RW) or (RO).

This recovery operation is performed even if SPACENAM specifies an object that is already started.

If the object is stopped when the command is issued, then the START DATABASE command both starts the object and clears the GRECP or LPL status. If the GRECP or LPL recovery action cannot complete, the object is still started.

If any table space or index space that is required to check command authority is unavailable, Installation SYSADM or Installation SYSOPR authority will be required to issue the START DATABASE command.

When recovering objects that are in GRECP or LPL status, avoid using pattern-matching characters (*) for both the database name and the space name. Multiple START DATABASE(*dbname*) SPACENAM(*) commands running in parallel should complete faster than one START DATABASE(*) SPACENAM(*) command.

If you use pattern-matching characters (*) for both the database name and space name, you must have DBMAINT authority and ensure that the catalog and directory databases have already been explicitly started in the following order:

- START DATABASE(DSNDB01) SPACENAM(SYSLGRNX, DSNLLX01, DSNLLX02)
- START DATABASE(DSNDB01) SPACENAM(*)
- START DATABASE(DSNDB06) SPACENAM(*)

Although not recommended, you can start an object using START DATABASE ACCESS(FORCE). That deletes all LPL and write error page range entries without recovering the pages. It also clears the GRECP status.

When a table space or partition is placed in the LPL because undo processing is needed for a NOT LOGGED table space, the **-START DATABASE** command does not remove the table space or partition from the LPL.

When starting a LOB table space defined as LOG NO and either in GRECP or having pages in the LPL, the LOB table space will be placed in the AUXW state and the LOB will be invalidated if Db2 detects that log records required for LPL recovery are missing due to the LOG NO attribute.

Use of ACCESS(FORCE): The ACCESS(FORCE) option is intended to be used when data has been restored to a previous level after an error, by DSN1COPY, or by a program that is not Db2 for z/OS, and the exception states resulting from the error still exist and cannot be reset. When using ACCESS(FORCE), it is up to the user to ensure the consistency of data with respect to Db2.

If an application process requests a transaction lock on a table space that is in a restrictive status (RECP) or has a required index in a restrictive status, Db2 acquires the lock. Db2 does not detect the status until the application tries to access the table space or index, when the application receives an error message indicating that the resource is not available (SQLCODE -904). After receiving this message, the application should release the lock, either by committing or rolling back (if the value of the RELEASE option is COMMIT) or by ending (if the value of RELEASE is DEALLOCATE). If you issue the command START DATABASE ACCESS(FORCE) for either the table space or the index space while the lock is in effect, the command fails.

If an object has retained locks (that is, a member of a Db2 data sharing group has failed and the locks it held on the object are retained in the lock structure), START DATABASE ACCESS (FORCE) is not allowed.

START DATABASE ACCESS(FORCE) does not execute if postponed abort or indoubt units of recovery exist. If you attempt to issue the START DATABASE ACCESS(FORCE) command in this situation, the command fails. FORCE cannot be used to reset the restart pending (RESTP) state.

Restricted mode (RO or UT): When a START DATABASE command for a restricted mode (RO and UT) takes effect depends on whether applications are started after the START DATABASE command has completed, or whether applications are executing at the time the command is issued. For applications that are started after START DATABASE has completed, access restrictions are effective immediately. For applications that are executing at the time START DATABASE is issued, the access restrictions take effect when a subsequent claim is requested or the application is allowed to run to completion. Whether the application is interrupted by the START DATABASE command depends on various factors. These factors include the ACCESS mode that is specified on the START DATABASE command, the type of drain activity, if any, on the table space or partition, and whether any cursors are being held on the table space or partition.

Do not start table spaces or index spaces for defined temporary tables with RO or UT access. You can start a temporary file database with UT access to accommodate the REPAIR DBD utility.

If the table space, index, or partition must be accessed in a mode that is incompatible with the ACCESS type currently in effect, Db2 issues a resource-unavailable message.

For shared-owner databases, a STOP DATABASE command must be issued to quiesce a database or table space prior to issuing the START DATABASE command.

Starting a table space partition in PRO restricted status: When a table space that is in Persistent Read Only (PRO) restricted status is started, the partition remains in PRO restricted status.

Communications database or resource limit facility: If the communications database (CDB) or resource limit facility (RLF) is currently being used by any member of the data sharing group, any attempt to start either active database or table space with ACCESS(UT) fails.

Synchronous processing completion: Message DSN9022I indicates that synchronous processing has completed successfully.

Asynchronous processing completion: Recovery of objects in GRECP status or with pages on the LPL is performed asynchronously. Message DSN1022I is issued periodically to give you the progress of the recovery. The starting of databases, table spaces, or indexes (a synchronous task) often completes before the recovery operation starts. Therefore, when Db2 issues message DSN9022I, which indicates that synchronous processing has completed, the recovery of objects might not be complete.

Message DSN1006I is issued in response to the START DATABASE command when the object (table space or index space) that is identified by TYPE and NAME has group buffer pool recovery pending (GRECP) or logical page list (LPL) status, and recovery was triggered. Message DSN1051I indicates that second pass log apply for GRECP or LPL recovery of an index space has started. The START DATABASE command does not complete until the asynchronous task of recovery completes.

Message DSN1021I indicates that asynchronous processing for an object has completed. You can issue the command DISPLAY DATABASE to determine whether the recovery operation for all objects is complete. If recovery is complete, the output from the command shows either a RW or a RO status without LPL or GRECP.

Starting a LOB table space: The **START DATABASE** command can be used to start LOB table spaces and indexes on auxiliary tables. LOB table spaces are started independently of the base table space with which the LOB table space is associated.

Examples

Example 1: Start table space DSN8S81E in database DSN8D81A. Recover the table space if it is in GRECP status or recover the pages on the LPL if one exists.

```
-START DATABASE (DSN8D81A) SPACENAM (DSN8S81E)
```

Example 2: Start all databases (except DSNDB01, DSNDB06, and work file databases) for which you have authority. Recovery for any objects with GRECP or LPL status is not performed.

```
-START DATABASE (*)
```

Example 3: Start the third and fourth partitions of table space DSN8S81E in database DSN8D81A for read-only access. Recover the partitions if they are in GRECP status or recover the pages on the LPL if one exists.

```
-START DATABASE (DSN8D81A) SPACENAM (DSN8S81E) PART (3,4) ACCESS (RO)
```

Example 4: Start all table spaces that begin with "T" and end with the string "IQUA03" in database DBIQUA01 for read and write access.

```
-START DATABASE (DBIQUA01) SPACENAM (T*IQUA03) ACCESS (RW)
```

This command produces output that is similar to the following output:

```
DSN9022I - DSNTDDIS 'START DATABASE' NORMAL COMPLETION
```

Example 5: Start clone objects.

```
-START DATABASE (MYDB*) SPACENAM (MYDB*SP) CLONE
```

Chapter 74. -START DB2 (Db2)

The Db2 command START DB2 initializes the Db2 subsystem. When the operation is complete, the Db2 subsystem is active and available to TSO applications and to other subsystems (for example, IMS and CICS).

The effect of restarting the system can be controlled by a conditional restart control record, which you create by using the DSNJU003 (change log inventory) utility. For more details about the effects, see “Usage notes” on page 443.

Important: Do not attempt to start Db2 at a code level that is lower than the catalog level or highest ever activated function level. For more information, see [Function levels and related levels in Db2 12 \(Db2 for z/OS What's New?\)](#).

Abbreviation: -STA DB2

Environment

This command can be issued only from a z/OS console. The name of the Db2 subsystem is determined by the command prefix. For example, -START indicates that the Db2 subsystem to be started is the one with '-' as the command prefix.

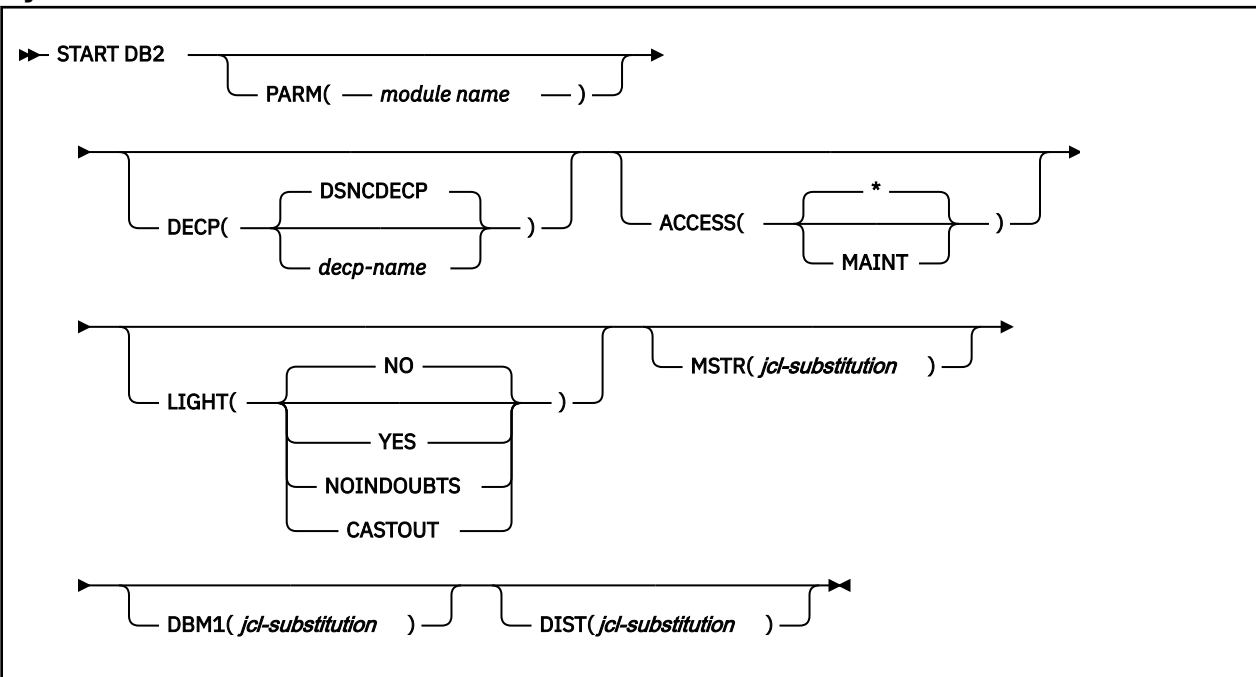

The command is rejected if the Db2 subsystem is already active. The restart recovery status of Db2 resources is determined from the prior Db2 shutdown status.

Data sharing scope: Member

Authorization

None is required. However, the command can be executed only from a z/OS console with the START command capability.

Syntax

Option descriptions

None of the following options are required.

PARM (*module-name*)

Specifies the load module that contains the Db2 subsystem parameters.

The default is the name of the parameter module that was specified on panel DSNTIPO when the installation CLIST was run. The default can also be changed if you update ZPARM(*default-module-name*) in the *ssnm*MSTR Db2 subsystem startup procedure.

DECP

Specifies the name of the load module that contains Db2 application parameter defaults.

decpr-name is the name of a module that is provided by the installation. The default name is DSNHDECP. If the specified module is not found or cannot be loaded, an error is issued, and the Db2 subsystem does not start.

ACCESS

Specifies whether access to Db2 is to be general or restricted.

Abbreviation: ACC

(*)

Makes access general; all authorized users can connect to Db2.

The **default** is ACCESS (*) .

(MAINT)

Prohibits access to any authorization IDs other than installation SYSADM, installation SYSOPR, and SECADM.

For data sharing, ACCESS(MAINT) restricts access on only the Db2 member on which you execute this command. Other members of the data sharing group are unaffected.

LIGHT

Specifies whether a light restart is to be performed in a data sharing environment.

(NO)

A light restart is not performed.

(YES)

Specifies that a light restart is to be performed. Db2 takes these actions:

- Starts with reduced storage.
- Waits for resolution of indoubt units of recovery.
- Frees retained locks. Page set P-locks in IX or SIX mode are not freed.
- Terminates normally.

(NOINDOUBTS)

Specifies that Db2, during a light restart, does not wait for indoubt units of recovery to resolve before it terminates.

(CASTOUT)

Specifies that a light restart is to be performed with castout processing. Db2 takes these actions:

- Starts with reduced storage.
- Waits for resolution of indoubt units of recovery.
- Performs castout processing.
- Frees retained locks. Page set P-locks in IX or SIX mode are freed, if possible.
- Terminates normally.

If a light restart does not resolve all indoubt and postponed-abort units of recovery, Db2 does not release the associated page set P-locks that are in IX or SIX mode. One reason for unresolved

postponed-abort units of recovery is that the LBACKOUT subsystem parameter is set to LIGHT or LIGHTAUTO.

MSTR (*jcl-substitution*)

Specifies parameters and values to be substituted in the EXEC statement of the JCL that executes the startup procedure for *ssnmMSTR*, the system services address space, where *jcl-substitution* is one or more character strings of the form *keyword=value*, enclosed between apostrophes. If you use more than one character string, separate each string with a comma and enclose the entire list between a single pair of apostrophes. For the list of supported keywords, see [Starting a system task from a console \(MVS System Commands\)](#).

Restriction: Db2 address spaces, and all connected address spaces, cannot be started with the REUSASID=YES keyword to use the z/OS reusable address space ID (ASID) capability.

Tip: You can omit the MSTR, DBM1, and DIST keywords, or omit any *jcl-substitution* keywords, to use the values specified in the address-space startup procedures, which are created when you run job DSNTIJMA during the installation process.

DBM1 (*jcl-substitution*)

Specifies parameters and values to be substituted in the EXEC statement of the JCL that executes the startup procedure for *ssnmDBM1*, the database services address space, where *jcl-substitution* is as described for MSTR.

DIST (*jcl-substitution*)

Specifies parameters and values to be substituted in the EXEC statement of the JCL that executes the startup procedure for *ssnmDIST*, the distributed services address space, where *jcl-substitution* is as described for MSTR.

Usage notes

Command prefix

If your installation has more than one Db2 subsystem, you must define more than one command prefix.

Conditional restart

A conditional restart control record can prevent a complete restart and specify current status rebuild only. In that case, the following actions occur during restart:

- Log records are processed to the extent that is determined by the conditional restart control record.
- The following values are displayed:
 - The relative byte address (RBA) of the start of the active log
 - The RBA of the checkpoint record
 - The status counts for units of recovery
 - The display table for restart unit of work elements
- The restart operation terminates with an abend.

Light restart with ARM

To enable a light restart in an ARM environment, you must code an ARM policy for Db2 and IRLM.

The following example shows an ARM policy for Db2, where the element name is the Db2 data sharing group name and member name concatenated. For example, DSND00GDB1G.

```
ELEMENT(  
  elementname  
)  
  
  RESTART_METHOD(SYSTEM,STC,'  
  cmdprfx  
  STA DB2,LIGHT(YES)')
```

The following example shows an ARM policy for IRLM, where the element name is the IRLM group name and the ID concatenated. For example, DXRDB0GDJ1G001.

```
ELEMENT(  
  elementname  
)  
  
  RESTART_METHOD(SYSTEM,STC,'  
  cmdprfx  
  S  
  irlmproc  
  ')
```

The element name that Db2 uses is the Db2 data sharing group name and member name concatenated. For example, DSNDB0GDB1G.F

Endless wait during start

The start operation might begin and fail to complete, if the system services address space starts and the database services address space cannot start. If a seemingly endless wait occurs, cancel the system services address space from the console, and check both startup procedures for JCL errors.

Starting members of a data sharing group

To start members of a data sharing group, you must enter a START DB2 command for each subsystem in the group. If it is the first startup of the group, you must start the originating member (the first Db2 that was installed) first.

Examples

Example 1

Start the Db2 subsystem.

```
-START DB2
```

Example 2

Start the Db2 subsystem, and provide a new value for the REGION parameter in the startup procedure for the system services address space.

```
-START DB2 MSTR('REGION=6000K')
```

Example 3

Start the Db2 subsystem. Assuming that the EXEC statement of the JCL that executes the startup procedure for the system services address space uses the symbol RGN, provide a value for that symbol.

```
-START DB2 MSTR('RGN=6000K')
```

Example 4

Db2 subsystems DB1G and DB2G are members of a data sharing group. Both were installed with a command prefix scope of STARTED. Start DB1G and DB2G by routing the appropriate commands to the z/OS system on which they are to be started, MVS1 and MVS2.

```
ROUTE MVS1,-DB1G START DB2  
ROUTE MVS2,-DB2G START DB2
```

Example 5

Start the Db2 subsystem, then provide the parameter module and a value for the DECP option. Enter either DSNCDECP or another *decp-name*

```
-START DB2 PARM(VA1AZNS) DECP(DSNHDVA1)
```

Chapter 75. -START DDF (Db2)

The Db2 command START DDF starts the distributed data facility (DDF) if it is not already started.

Abbreviation: -STA DDF

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

➤ START DDF ➤

Usage note

The START DDF command activates the DDF interface to VTAM and TCP/IP. When this command is issued after STOP DDF MODE(SUSPEND), suspended threads are resumed and DDF activity continues.

Example

Start the distributed data facility.

```
-START DDF
```

Chapter 76. -START DYNQUERYCAPTURE (Db2)

The Db2 command START DYNQUERYCAPTURE stabilizes access paths for qualified cached dynamic queries. This command can also optionally start monitoring of cached dynamic queries that qualify for a scope but have not met the specified execution threshold for stabilization.

All statements in the dynamic statement cache are qualified for capture, with the following exceptions:

- Queries that were prepared with the REOPT(AUTO) bind option
- Queries that were prepared with the CONCENTRATE STATEMENT WITH LITERALS bind option
- Queries that were transformed because they reference system temporal, application temporal, or archived transparency tables and one or more of the following settings uses a non-default value:
 - CURRENT SYSTEM TEMPORAL TIME special register
 - CURRENT BUSINESS TEMPORAL TIME special register
 - GET_ARCHIVE global variable

Abbreviation: -STA DYNQUERY

Environment

This command can be issued from the z/OS console, through a batch job, or the instrumentation facility interface (IFI).

Data sharing scope: Member

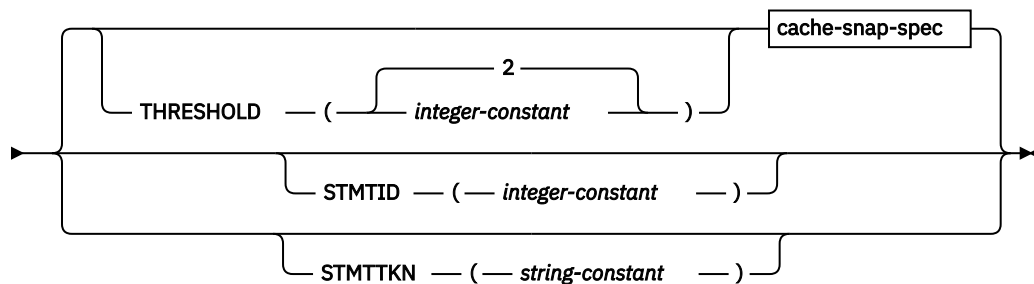

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Syntax

➤ START DYNQUERYCAPTURE — STBLGRP(*stabilization-group*) ➤

cache-snap-spec

Option descriptions

STBLGRP

A user provided stabilization group name. You can use the stabilization group to logically associate a set of queries. The stabilization group name can be used as input to a FREE command to free all the queries for a stabilization group.

THRESHOLD

The threshold for stabilizing dynamic SQL statements. When the number of executions for a qualified statement is equal to or greater than the *integer-constant* value, the statement is scheduled for stabilization.

Statement executions are counted only when IFCID 0316 and IFCID 0318 are both activated. Otherwise the execution count remains 0.

The default value is 2.

STMTID

Stabilize an individual statement that has the specified STMTID value in the dynamic statement cache.

STMTTKN

Stabilize an individual statement that has the specified STMTTKN value.

CURSQLID

Specifies the scope of statements captured:

Capture all dynamic SQL statements. This is the default value.

SQLID

The scope of captured dynamic SQL statements is limited to statements that have the CURRENT SQLID value.

MONITOR

Specifies whether to process statements in the statement cache and stop, or to process the statements in the statement cache and enable monitoring of queries that qualify for the scope, but have not met the THRESHOLD value.

NO

Schedule stabilization for qualified statements within the cache that exceed the execution threshold.

YES

Schedule stabilization for qualified statements that exceed the execution threshold, and monitoring for qualified statements that have not met the execution threshold.

If a statement is eligible for capture under more than one monitor, the monitor with the lower threshold applies. If multiple eligible monitors have the same threshold, the monitor that was started first applies.

SCOPE

Specifies the scope of the command.

LOCAL

Starts the capture on the local Db2 system only.

GROUP

Starts the capture on all members of the data sharing group.

Usage notes

Stopping and starting Db2

If Db2 is stopped and started after you have started a DYNQUERY CAPTURE MONITOR, the monitor is not restarted automatically.

Specifying SCOPE (GROUP)

If a monitor is started with SCOPE(GROUP), and a new member joins the data sharing group after the monitor is started, the monitor is not started automatically at the new member.

Examples

Stabilize queries in the dynamic cache with CURRENT SQLID of ADMF001 and have been executed at least 50 times

You issue the following command:

```
-STA DYNQUERYCAPTURE STBLGRP(ABC) THRESHLD(50) CURSQLID(ADMF001)
```

The output is similar to the following example:

```
DSNX221I -DB2A DSNXESTC DYNAMIC QUERY CAPTURE FOR  
COMMAND NUMBER 3 STARTED SUCCESSFULLY.  
DSNX222I -DB2A DSNXESC1 DYNAMIC QUERY CAPTURE  
COMPLETED FOR COMMAND NUMBER 3 WITH 20 STATEMENTS SCHEDULED,  
20 STATEMENTS STABILIZED, AND 0 STATEMENTS ALREADY STABILIZED.
```

Stabilize all queries in the dynamic cache of each member in the data sharing group that have been executed at least 200 times

You issue the following command:

```
-STA DYNQUERYCAPTURE STBLGRP(DEF) THRESHLD(200) SCOPE(GROUP)
```

The output is similar to the following example. The numbers in the output are accumulated from all members in the data sharing group:

```
DSNX221I -DB2A DSNXESTC DYNAMIC QUERY CAPTURE FOR  
COMMAND NUMBER 2 STARTED SUCCESSFULLY.  
DSNX222I -DB2A DSNXESC1 DYNAMIC QUERY CAPTURE  
COMPLETED FOR COMMAND NUMBER 2 WITH 50 STATEMENTS SCHEDULED,  
50 STATEMENTS STABILIZED, AND 3 STATEMENTS ALREADY STABILIZED.
```

Output

Message DSNX221I is issued when the START DYNQUERYCAPTURE command contains no syntax errors.

Message DSNX222I is issued at the completion of processing for the START DYNQUERYCAPTURE command.

Message DSNX223I is issued if a previous START DYNQUERYCAPTURE command specified the same SQLID.

Related concepts

[Dynamic SQL plan stability \(Db2 Performance\)](#)

Related tasks

[Stabilizing access paths for dynamic SQL statements \(Db2 Performance\)](#)

Related reference

[-STOP DYNQUERYCAPTURE \(Db2\)](#)

The Db2 command STOP DYNQUERYCAPTURE stops the capture of dynamic SQL statements by the specified monitors.

-DISPLAY DYNQUERYCAPTURE (Db2)

The Db2 command DISPLAY DYNQUERYCAPTURE displays all currently active dynamic query capture monitors.

FREE STABILIZED DYNAMIC QUERY (DSN)

The DSN subcommand FREE STABILIZED DYNAMIC QUERY removes from certain catalog tables one or more stabilized dynamic queries. If any of the specified queries are in the dynamic statement cache, FREE STABILIZED DYNAMIC QUERY purges the statements from the dynamic statement cache.

Related information

DSNX221I (Db2 Messages)

DSNX222I (Db2 Messages)

DSNX223I (Db2 Messages)

Chapter 77. -START FUNCTION SPECIFIC (Db2)

The Db2 command START FUNCTION SPECIFIC starts an external function that is stopped. Built-in functions or user-defined functions that are sourced on another function cannot be started with this command.

On successful completion of the command, queued requests for the specified functions begin executing. The abend counts for those functions are set to zero.

You do not need to issue the START FUNCTION SPECIFIC command when defining a new function to Db2. Db2 automatically starts the new function on the first SQL statement that invokes the new function.

Historical statistics in the DISPLAY FUNCTION SPECIFIC report (MAXQUE, TIMEOUT) are reset each time a START FUNCTION SPECIFIC command is issued for a given function.

Abbreviation: -STA FUNC SPEC

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel, an IMS or CICS terminal, or a program that uses the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the value of the SCOPE option.

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities for each function:

- Ownership of the function
- RECOVER privilege
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

If you specify START FUNCTION SPECIFIC *.* or *schema.partial-name **, the privilege set of the process must include one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

*** (asterisk)(*)**

Starts all functions in all schemas. This is the default.

(schema.specific-function-name)

Starts the specific function name in the schema. You cannot specify a function name in the same way that you do in SQL; you must use the specific name. If a specific name was not specified on the `CREATE FUNCTION` statement, query `SYSIBM.SYSROUTINES` for the correct specific name:

```
SELECT SPECIFICNAME, PARM_COUNT
FROM SYSIBM.SYSROUTINES
WHERE NAME='function_name'
AND SCHEMA='schema_name';
```

For overloaded functions, this query can return multiple rows.

(schema.partial-name *)

Starts all functions or a set of functions in the specified schema. The specific names of all functions in the set begin with *partial-name* and can end with any string, including the empty string. For example, `schema1.ABC*` starts all functions with specific names that begin with `ABC` in `schema1`.

SCOPE

Specifies the scope of the command.

(LOCAL)

Specifies that the command applies only to the current member.

(GROUP)

Specifies that the command applies to all members of the data sharing group.

Usage notes

Language Environment in the WLM-established stored procedure address space: The `START FUNCTION SPECIFIC` command does not refresh the Language Environment in the WLM-established stored procedure address space. You must issue the WLM command. For example, if you need to refresh the Language Environment to get new copies of user-defined function load modules, issue the following WLM command:

```
VARY WLM, APPLENV=applenv,REFRESH
```

Considerations for SQL functions: The `START FUNCTION SPECIFIC` command affects all versions of the SQL functions that you specify in the command.

Examples

Example 1: Start all functions.

```
-START FUNCTION SPECIFIC
```

Output that is similar to the following output is generated:

```
DSNX973I - DSNX9ST2 START FUNCTION SPECIFIC SUCCESSFUL FOR *.*  
DSN9022I - DSNX9COM '-START FUNC' NORMAL COMPLETION
```

Example 2: Start functions USERFN1 and USERFN2. If any requests are queued for these functions, the functions are executed.

```
-START FUNCTION SPECIFIC(PAYROLL.USERFN1,PAYROLL.USERFN2)
```

Output that is similar to the following output is generated:

```
DSNX973I - DSNX9ST2 START FUNCTION SPECIFIC SUCCESSFUL FOR  
PAYROLL.USERFN1  
DSNX973I - DSNX9ST2 START FUNCTION SPECIFIC SUCCESSFUL FOR  
PAYROLL.USERFN2  
DSN9022I - DSNX9COM '-START FUNC' NORMAL COMPLETION
```

Chapter 78. START irlmproc (z/OS IRLM)

The START *irlmproc* command starts an IRLM component with a procedure that is defined by the installation. Symbolic parameters in the procedure can be overridden on the START *irlmproc* command.

Environment

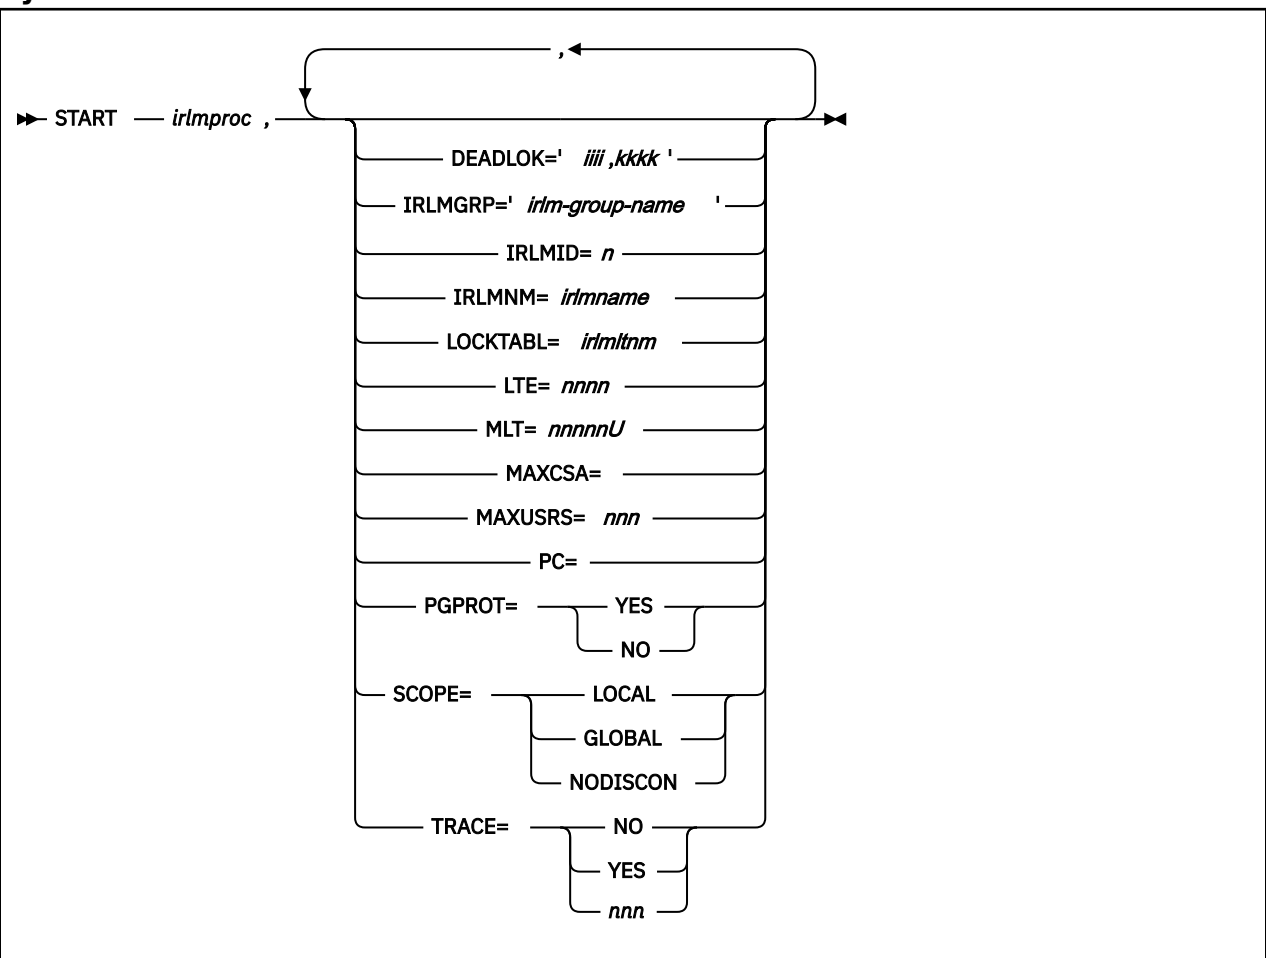

This command can be issued only from a z/OS console.

Data sharing scope: Member

Authorization

The command requires an appropriate level of operating system authority.

Syntax

Options must be separated by commas, with no spaces.

Option descriptions

irlmproc

Specifies the procedure name of the IRLM to be started.

None of the following options are required:

DEADLOK=' *iiii,kkkk* '

Specifies the local deadlock-detection interval in seconds (*iiii*), and the number of local cycles (*kkkk*) that are to occur before a global detection is initiated.

iiii

Is a one- to four-digit number. Values between 1 and 5 are interpreted as seconds. Values between 100 and 5000 are interpreted as milliseconds. Depending on the value that you enter, IRLM might substitute a smaller maximum value.

kkkk

Is a one- to four-digit number from 1 to 9999 that specifies the number of local deadlock cycles that must expire before global deadlock detection is performed. You can specify any value from 1 to 9999, but IRLM uses 1. The recommended value to specify is 1.

In a data sharing environment, IRLM synchronizes all of the DEADLOK values in the group to the values specified on the most recent IRLM to join the group. The DEADLOK values can be changed by starting a member with the values that you want. To reduce confusion, it is recommended that the installation specify the same value for DEADLOK on all of its IRLM startup procedures and use the START *irlmproc* command to override this value only when the interval must be increased from its original value.

IRLMGRP=' *irlm-group-name* '

Specifies the name of the cross system coupling facility (XCF) group, in a data sharing environment, to which the IRLM belongs as the lock manager for DBMSs that share the same data. All IRLMs in the same group must specify the same value for LOCKTABL and unique values for IRLMID.

The group name is used as the XCF group name. The name must not start with 'SYS' and must not be the same name specified for LOCKTABL.

In a non-data-sharing environment (SCOPE=LOCAL), IRLMGRP is ignored.

IRLMID= *n*

Specifies a decimal number that is used to distinguish between IRLMs in a data sharing group.

n can be either a one- to three-digit number from 1 to 255, or a printable character in quotation marks. Note that this IRLM ID does not relate directly to the limit of IRLM members that can be in the group. That limit is determined by the current hardware limits (currently 32).

When *n* is specified as a printable character, IRLM uses the EBCDIC value of the printable character as the IRLMID (such as X'C4'). The printable character must be surrounded by enough single quotes to permit IRLM to see it as a printable character. Because of the way that the operating system interprets quotes, single quotes must be on either side of the characters. For example, if you want to specify the printable character 'D', you must specify it here as IRLMID='D'.

A unique IRLMID must be specified for each IRLM in a group (IRLMs with the same value specified for the IRLMGRP option).

IRLMNM= *irlmname*

Specifies a 4-byte z/OS subsystem name assigned to this IRLM. (Although z/OS can accept names that are less than 4 bytes, IRLM requires a 4-byte name.)

LOCKTABL= *irlmltnm*

Specifies the lock table to be used by this group. This option is overridden by Db2; it is needed in an IMS environment.

In a non-data-sharing environment (SCOPE=LOCAL), LOCKTABL is ignored.

LTE= *nnnn*

Specifies the number of lock table entries that are required in the coupling facility (CF) lock structure in units of 1048576 entries. LTE= can have a value of blank, zero, or any exact power of two up to 2048 (inclusive). The number of lock table entries in the group is determined by the first IRLM to connect to the group during initial structure allocation or during REBUILD.

The LTE value is used in the following order:

1. The value that is specified using MODIFY irlmproc,SET,LTE= if the value is greater than zero.
2. The value from LTE= in the irlmproc if the value is greater than zero.
3. The value that is determined by the existing logic, which divides the XES structure size returned on the IXCQUERY call by two times LTE width. The result is rounded to the nearest power of two, which the existing logic uses for the value.

Note: The LTE width is determined by the MAXUSRS value.

If IRLM attempts to use a value from MODIFY irlmproc,SET,LTE= that is greater than the available storage in the structure size returned by XES IXCQUERY, the value for the LTE= in the irlmproc is used. If this value is greater than the available storage, IRLM uses the value that is determined by the existing logic.

Table 23. Some common values for lock table entries and the required lock table storage

For LTE=	Lock Table Storage needed for 2-byte entries	Lock Table Storage needed for 4-byte entries
8	16 MB	32 MB
16	32 MB	64 MB
32	64 MB	128 MB
64	128 MB	256 MB
128	256 MB	512 MB
256	512 MB	1024 MB

MLT= nnnnnU

Specifies the upper limit of private storage above the two gigabyte bar, also called the MEMLIMIT, that is managed by MVS. This storage is used for locks and deadlock processing. The value *nnnnn* is a five digit number in the range 1 through 99999. *U* is a one character unit indicator with the value of M for megabytes, G for gigabytes, T for terabytes, or P for petabytes. The MLT value that is specified for IRLM must be at least 2 GB. The setting of the MEMLIMIT value through the MLT parameter is temporary, holding only as long as the execution of the IRLM instance. To make a permanent MEMLIMIT change, update the MEMLIMIT value in the corresponding IRLM startup procedure.

MAXCSA=

MAXCSA= is a required positional parameter but is currently unused.

MAXUSRS= nnn

Specifies the initial maximum number of members in the data sharing group, set by the IRLM which results in structure allocation. The specified value determines the size of each lock entry in the lock table portion of the lock structure, as shown in the following table.

Table 24. Effect of MAXUSRS on initial size of lock table entry

MAXUSRS	Initial size of lock entry
7 or less	2 bytes
≥ 8 and < 24	4 bytes
≥ 24 and < 33	8 bytes

nnn must be a one- to two-digit number from 1 to 32. The default is 7. The recommended value is 7 or less.

In a non-data-sharing environment (SCOPE=LOCAL), MAXUSRS is ignored.

PC=

PC= is a required positional parameter but is currently unused.

PGPROT=

Specifies whether the IRLM load modules that are resident in common storage are placed in z/OS page-protected storage.

YES

The IRLM load modules that are resident in common storage are placed in z/OS page-protected storage.

NO

The IRLM load modules that are resident in common storage are not placed in z/OS page-protected storage.

SCOPE=

Specifies whether the IRLM is to be used in a data sharing environment.

LOCAL

Specifies the IRLM is in a non-data-sharing environment and there is no intersystem sharing.

GLOBAL

Specifies the IRLM is in a data sharing environment and that intersystem sharing is to be performed.

NODISCON

Specifies that IRLM is in a data sharing environment and that intersystem sharing is to be performed. IRLM remains connected to the data sharing group even when no database management systems are identified to it. You must explicitly stop IRLM to bring it down.

If you specify the NODISCON option, there is less impact on other systems when a Db2 subsystem fails because the operating system is not required to perform certain recovery actions that it normally performs when IRLM comes down. Using the NODISCON option might allow Db2 to restart more quickly after a Db2 subsystem normally or abnormally terminates because it does not have to wait for IRLM to rejoin the IRLM data sharing group.

TRACE=

Specifies whether the IRLM is to capture traces in wrap-around IRLM buffers. Each buffer is reused when the previous buffer is filled. Traces are captured at IRLM startup. You should specify TRACE=YES in the *irlmproc* procedure to place traces in wrap-around mode.

NO

Does not initialize trace activity during IRLM startup. NO is the default.

The TRACE CT command can be used to trace IRLM activity after IRLM startup.

YES

Initializes IRLM trace activity during startup.

nnn

Specifies the number of z/OS component trace (CTRACE) buffers, and initializes all IRLM CTRACE activities during startup. *nnn* must be in the range 10 to 255.

Examples

Example: This command starts the IRLM with a lock table storage size of 64 MB, assuming a width of 2-bytes for each lock table entry.

Enter the following command on the system console:

```
S irlmproc,LTE=32
```

If this value is correct, message DXR132I, which is displayed after successful connection to the lock structure, displays the value used by IRLM. If this value is incorrect, START will terminate with DXR116E CODE=24 and ABENDU2018. This value is only used if SCOPE=GLOBAL or SCOPE=NODISCON and has a default value calculated by IRLM.

Chapter 79. -START ML (Db2)

The Db2 command START ML starts IBM Db2 AI for z/OS.

Abbreviation: -STA ML

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

```
➤➤ START ML ➤➤
```

Usage note

The START ML command activates IBM Db2 AI for z/OS. In a data sharing environment, this command activates IBM Db2 AI for z/OS on all members in the data sharing group.

Example

Start IBM Db2 AI for z/OS.

```
-START ML
```

Related reference

[-STOP ML \(Db2\)](#)

The Db2 command STOP ML stops the IBM Db2 AI for z/OS if it is already been started

[-DISPLAY ML \(Db2\)](#)

The Db2 command DISPLAY ML displays the current status of IBM Db2 AI for z/OS.

Chapter 80. -START PROCEDURE (Db2)

The Db2 command START PROCEDURE activates the definition of a stored procedure that is stopped or refreshes one that is stored in the cache. You can qualify stored procedure names with a schema name.

On successful completion of the command, queued requests for the specified stored procedures begin to execute. The abend counts for the specified procedures are set to zero. Db2 resets the MAXQUE and TIMEOUT statistics to 0 each time that you execute the START PROCEDURE command.

You do not need to issue START PROCEDURE when you define a new stored procedure to Db2. Db2 automatically activates the new definition when it first receives an SQL CALL statement for the new procedure.

Abbreviation: -STA PROC

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the value of the SCOPE option.

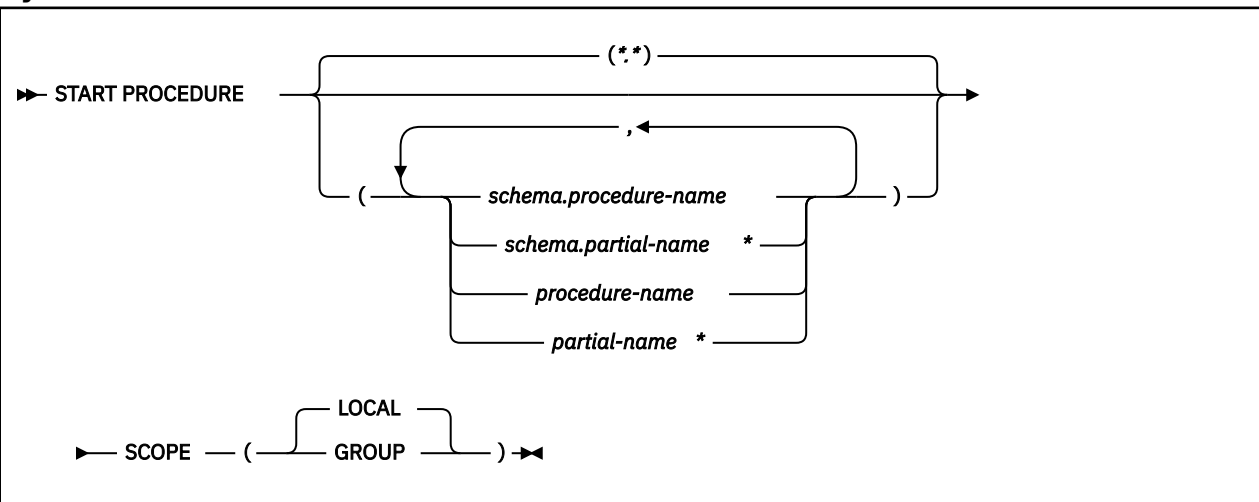

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- Ownership of the stored procedure
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

(*.*)

Marks all stored procedures in all schemas as available to be called.

(*schema.procedure-name*)

Starts the specified stored procedure in the specified schema.

(*schema.partial-name* *)

Starts a set of stored procedures in the specified schema. The names of all procedures in the set begin with *partial-name* and can end with any string, including the empty string. For example, PAYROLL.ABC* starts all stored procedures with names that begin with ABC in the PAYROLL schema.

procedure-name

Marks one or more specific stored procedures as available to be called.

***partial-name* ***

Marks a set of stored procedures in the SYSPROC schema as available to be called. The names of all procedures in the set begin with *partial-name* and can end with any string, including the empty string. For example, ABC* starts all stored procedure names that begin with ABC in the SYSPROC schema.

SCOPE

Specifies the scope of the command.

(LOCAL)

Starts the specified stored procedures in only the local members.

(GROUP)

Starts the specified stored procedures in all members of the data sharing group.

Usage notes

Errors in a definition of a stored procedure: Errors are detected at create time for a stored procedure.

Considerations for native SQL procedures: The START PROCEDURE command affects all versions of the native SQL procedures that you specify in the command.

Examples

Example 1: Start all stored procedures.

```
-START PROCEDURE
```

This command produces output that is similar to the following output:

```
DSNX946I - DSNX9ST2 START PROCEDURE SUCCESSFUL FOR *.*
DSN9022I - DSNX9COM '-START PROC' NORMAL COMPLETION
```

Example 2: Make the stored procedures USERPRC1 and USERPRC2 available to be called, and start any requests that are waiting for those procedures.

```
-START PROCEDURE(USERPRC1,USERPRC2)
```

This command produces output that is similar to the following output:

```
DSNX946I - DSNX9ST2 START PROCEDURE SUCCESSFUL FOR USERPRC1
DSNX946I - DSNX9ST2 START PROCEDURE SUCCESSFUL FOR USERPRC2
DSN9022I - DSNX9COM '-START PROC' NORMAL COMPLETION
```

Chapter 81. -START PROFILE (Db2)

The Db2 command START PROFILE loads or reloads the profile table into a data structure in memory.

Important: If the value of the PROFILE_AUTOSTART subsystem parameter is set to YES, the START PROFILE command is issued automatically as part of Db2 start processing.

If this data structure already exists, Db2 deletes it, and a new structure is created. The profile table must be loaded by issuing the command above explicitly. The table is not loaded when the database is initialized at the startup time. After loading the database, the functions specified in the profile become active. Only the rows in the profile table with column PROFILE_ENABLED='Y' are activated.

Abbreviation: -STA PROFILE

Environment

This command can be issued from the z/OS console, through a batch job or the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Syntax

► START PROFILE ◄

Examples

Example 1: This command is required to load the profile table into memory.

```
-START PROFILE
```

Chapter 82. -START RLIMIT (Db2)

The Db2 command START RLIMIT starts the resource limit facility (governor) and specifies a resource limit specification table for the facility to use.

You can issue START RLIMIT even if the resource limit facility or resource limit table is already active. Db2 reads resource limit tables into memory to use for START RLIMIT command processing. When you update the active resource limit tables, Db2 detects the resource limit changes and automatically refreshes the in-memory resource limit tables with these changes.

Deprecated function: The following resource limit table formats are deprecated:

- Starting in Db2 12, DSNRLSTxx table formats and related index formats from before DB2 Version 8 format are not supported. When Db2 detects DSNRLSTxx tables with unsupported formats, it issues message DSNT731I.
- DSNRLMTxx table formats and related index formats from before Db2 11 are deprecated. Starting in Db2 12, if Db2 detects DSNRLMTxx tables in a deprecated format, it issues message DSNT732I, processing for the START RLIMIT command continues, and the resource limit facility starts using the deprecated objects.

For more information, see [Convert RLF tables to the current format \(Db2 Installation and Migration\)](#).

Abbreviation: -STA RLIM

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the SCOPE option.

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option description

The following keywords are optional.

ID= *id*

Identifies the resource limit specification table for the governor to use.

id is the one or two identification character that is specified when the table is created. You can start a resource limit table that is already active by specifying the same ID that was specified in the last START RLIMIT command.

The full name of the table is *authid.DSNRLSTid* or *authid.DSNRLMTid*, where *authid* is the value that is specified in field RESOURCE AUTHID on installation panel DSNTIPP.

The **default** ID is specified by the value of the RLFTBL subsystem parameter.

SCOPE

Specifies the scope of the command in a data sharing group.

(LOCAL)

Starts the resource limit facility for the local member only. This is the default value.

(GROUP)

Starts the resource limit facility for the entire data sharing group.

Examples

Example 1: Start the resource limit facility using the DSNRLST01 resource limit table.

```
-START RLIMIT ID=01
```

Example 2: Start the resource limit facility using the DSNRLST01 resource limit table for all members of the data sharing group.

```
-START RLIMIT ID=01 SCOPE(GROUP)
```

[DSNRLMTxx resource limit tables \(Db2 Performance\)](#)

[DSNTIPP: Protection panel \(Db2 Installation and Migration\)](#)

[RLST NAME SUFFIX field \(RLFTBL subsystem parameter\) \(Db2 Installation and Migration\)](#)

Chapter 83. -START RESTSVC (Db2)

The Db2 command START RESTSVC starts the definition of a REST service that is stopped. You can qualify REST service names with a collection ID name.

On successful completion of the command, the specified REST services will be started and any new requests for the specified REST services can begin to execute.

When a new REST service is created, Db2 automatically starts the new REST service.

Abbreviation: -STA RESTSVC

Environment

This command can be issued from a z/OS® console, a DSN session under TSO, a DB2I panel (Db2 COMMANDS), an IMS™ or CICS® terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group

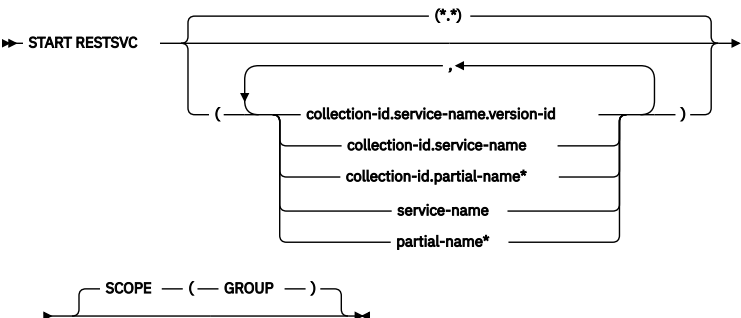

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

For mixed case names, use single quotes (') around the input.

(*.*)

Marks all versions of all REST services in all collection-ids as available to be invoked. Note: when specified, `*,*` can be the only RESTSVC parameter.

(collection-id.service-name.version-id)

Starts a specific version of the specified REST service in the specified collection-id.

(collection-id.service-name)

Starts all versions of the specified REST service in the specified collection-id.

(collection-id.partial-name*)

Starts all versions in a set of REST services in the specified collection-id. The names of all REST services in the set begin with partial-name and can end with any string, including the empty string. For example, PAYROLL.ABC* starts all REST services with names that begin with ABC in the PAYROLL collection-id.

(service-name)

Starts all versions of the specified REST service in the SYSIBMSERVICE collection-id.

(partial-name*)

Starts all versions in a set of REST services in the SYSIBMSERVICE collection-id. The names of all REST services in the set begin with partial-name and can end with any string, including the empty string. For example, ABC* starts all REST services names that begin with ABC in the SYSIBMSERVICE collection-id.

SCOPE

Specifies the scope of the command.

(GROUP)

Starts the specified REST services in all members of the data sharing group.

Usage notes

Errors in a definition of a REST service: Errors are detected at create time for a REST service created with the VALIDATE(BIND) BIND option, and a discover or invoke time for a REST service created with VALIDATE(RUN) BIND option.

The START RESTSVC command affects all versions of the REST services that you specify in the command.

Output

Message [DSNL601I \(Db2 Messages\)](#) indicates the beginning of the output of a START RESTSVC command. Message [DSN9022I \(Db2 Messages\)](#) will indicate the end of the output of the command if no failure occurred during the processing of the command. Message [DSN9023I \(Db2 Messages\)](#) will indicate the end of the output of the command if an abend had occurred during the processing of the command.

Examples**Example: No authority for a START RESTSVC command**

The following command attempts to use the START RESTSVC command on a service that the user does not have the proper authorities for:

```
-DB2A STA RESTSVC('DB2zRESTServiceTestCollectionID.simpleSelect3')
```

The output is similar to this output:

```
DSNL601I -DB2A STA RESTSVC REPORT FOLLOWS-
DSNL604I -DB2A USER HAS INSUFFICIENT AUTHORITY FOR START RESTSVC OF
DB2zRESTServiceTestCollectionID.simpleSelect3
DSN9022I -DB2A DSNLJDSS 'START RESTSVC' NORMAL COMPLETION
```

Example: Start all services within a collection ID

The following command starts all services with the *BankDemo* collection ID name:

```
-DB2A STA RESTSVC('BankDemo.*')
```

The output is similar to this output:

```
DSNL601I -DB2A STA RESTSVC REPORT FOLLOWS-
DSNL607I -DB2A ALL SERVICES HAVE BEEN START FOR BankDemo.*
DSN9022I -DB2A DSNLJDSS 'START RESTSVC' NORMAL COMPLETION
```

Related reference

BIND SERVICE (DSN)

The BIND SERVICE (DSN) subcommand builds an application package that represents a Db2 REST service. Db2 records the description of the service in the catalog tables and saves the prepared package in the directory.

BIND and REBIND options for packages, plans, and services

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

-DISPLAY RESTSVC (Db2)

The Db2 command DISPLAY RESTSVC displays the status of REST services that exist in Db2.

FREE SERVICE (DSN)

The FREE SERVICE (DSN) subcommand deletes an application package that represents a Db2 REST service. The command also removes the corresponding entry from the catalog tables.

-STOP RESTSVC (Db2)

The Db2 command STOP RESTSVC prevents Db2 from accepting any new discover details or invoke requests for one or more REST services. You can qualify REST service names with a collection ID name.

Chapter 84. -START TRACE (Db2)

The Db2 command START TRACE starts Db2 traces.

An additional option for this command and additional values for a few other options exist. This additional information is intended for service and use under the direction of IBM Support.

Abbreviation: -STA TRA

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the value of the SCOPE option.

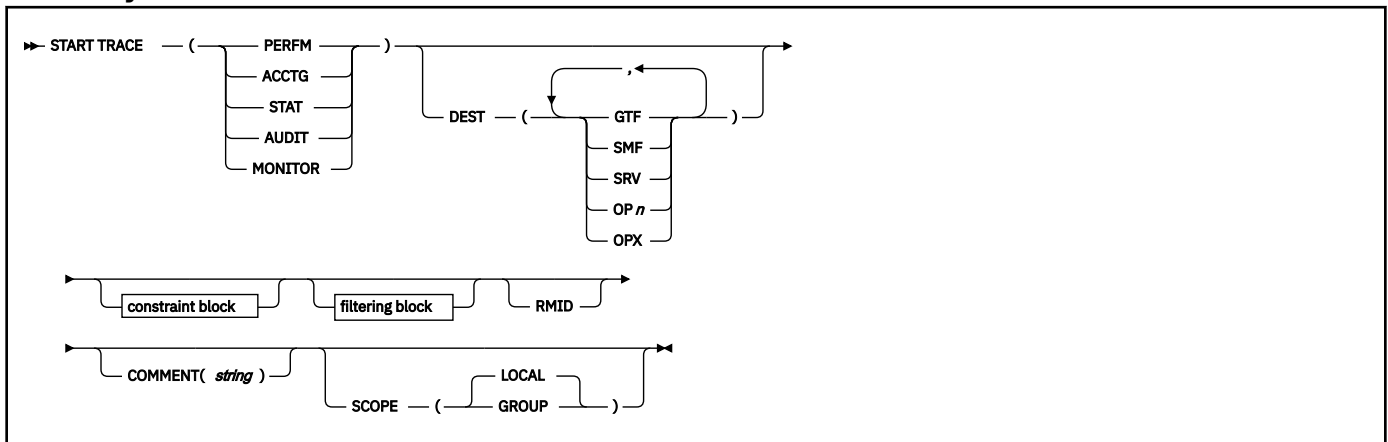

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

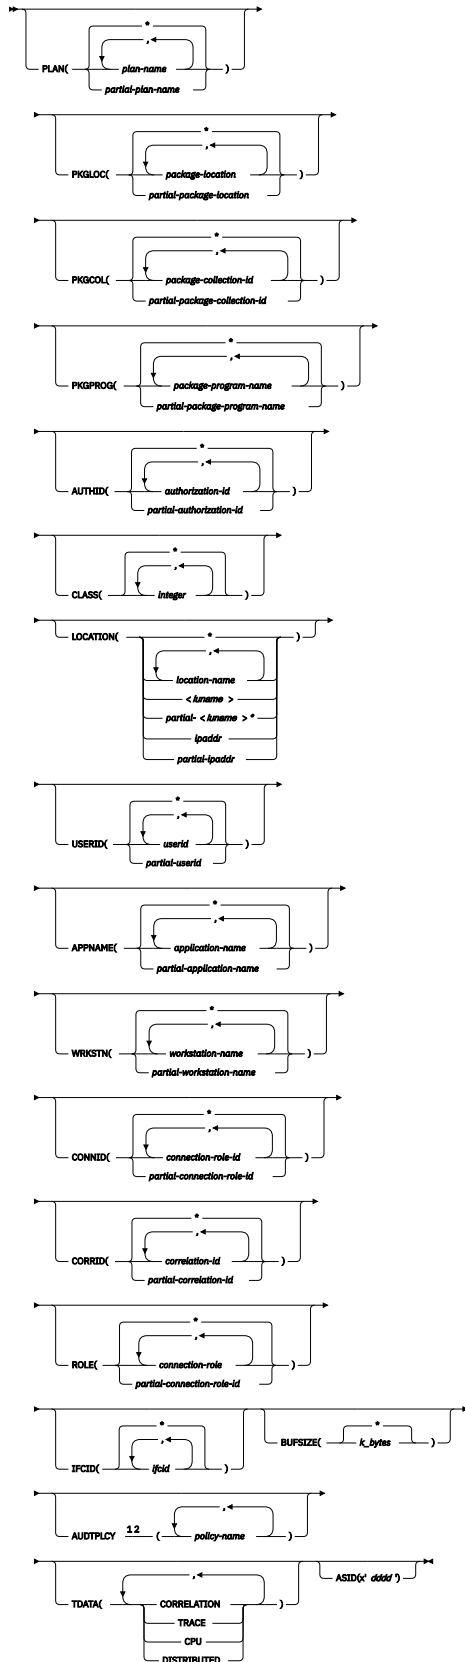

- TRACE privilege
- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority
- SECADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

constraint block

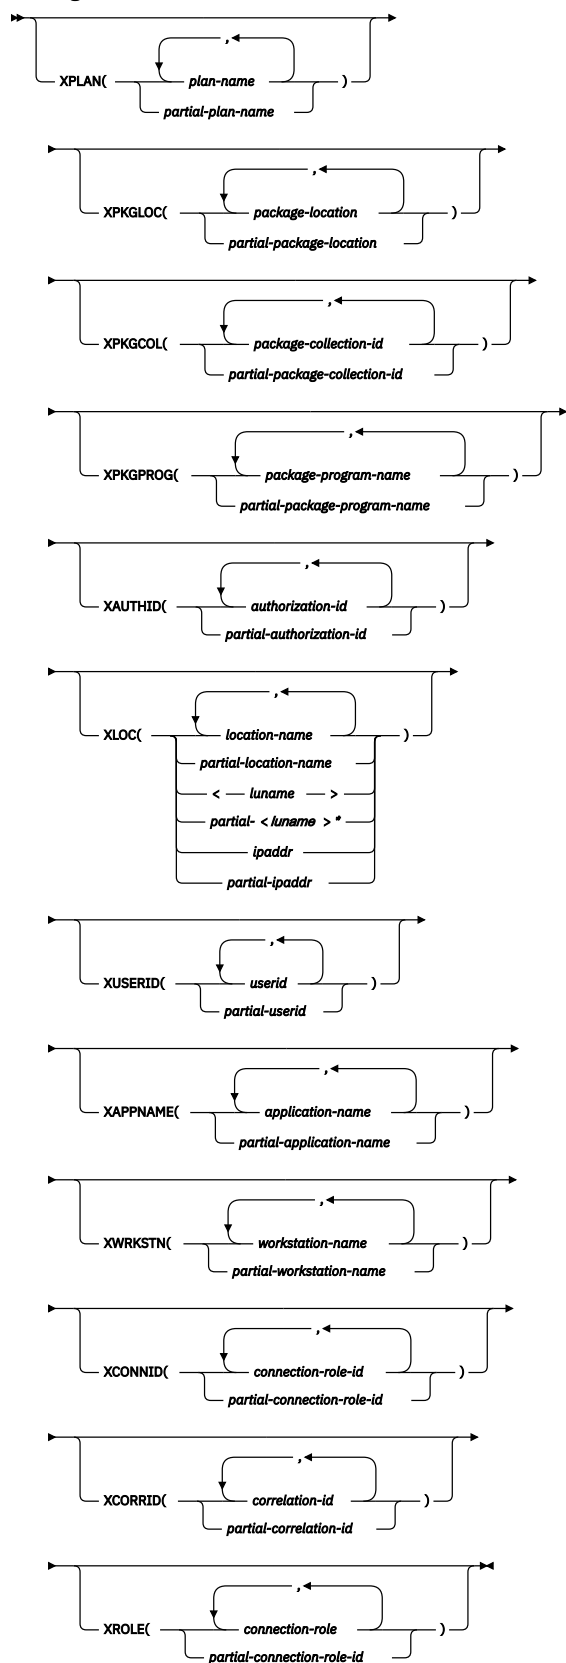

Notes:

¹ Do not specify CLASS or IFCID with AUDTPLYC. AUDTPLYC applies to trace type AUDIT.

² Specifying multiple AUDTPLCY traces with different filtering criteria causes the filtering to become a UNION among all AUDTPLCY traces.

filtering block

Option descriptions

You must specify a trace type.

The options PERFM, ACCTG, STAT, AUDIT, and MONITOR identify the type of trace that is started.

(PERFM)

The *performance trace* is intended for performance analysis and tuning. This trace includes records of specific events in the system, including events related to distributed data processing. The data can be used for program, resource, user, and subsystem-related tuning.

Abbreviation: P

(ACCTG)

The *accounting trace* records transaction-level data that is written when the processing for a transaction is completed. It provides data that enables you to conduct Db2 capacity planning and to tune application programs.

Abbreviation: A

(STAT)

The *statistics trace* collects statistical data that is broadcast by various components of Db2 at certain time intervals. You can specify intervals for statistics collection during installation.

Abbreviation: S

LOCATION cannot be specified when you choose a statistics trace.

(AUDIT)

The *audit trace* collects information about Db2 security controls and can be used to ensure that data access is allowed only for authorized purposes.

Abbreviation: AU

(MONITOR)

The *monitor trace* enables attached monitor programs to access Db2 trace data through calls to the instrumentation facility interface (IFI). Monitor programs can access the trace data asynchronously through an OPx buffer by issuing READA requests, or synchronously in the monitor return area by issuing READS requests.

Abbreviation: MON

SCOPE

Specifies the scope of the command in a data sharing group.

(LOCAL)

Specify to start traces on the local member only.

(GROUP)

Specify to start traces on all members of the data sharing group.

FL 509 You cannot specify SCOPE(GROUP) to start audit traces that use tamper-proof audit policies.

ASID(x'dddd')

Specifies the address space for which trace data is collected.

dddd is a four-byte hexadecimal address space ID (ASID).

COMMENT (string)

Gives a comment that is reproduced in the trace output (except in the resident trace tables). This option can be used to record why the command was issued.

string is any character string; it must be enclosed between apostrophes if it includes a blank, comma, or special character.

RMID

Specifies resource manager identifier. You can specify up to 8 valid RMIDs, which are one or two digit identifiers. You cannot specify RMID for accounting or statistic traces.

DEST

Specifies where the trace output is to be recorded. You can use more than one value, but do not use the same value twice. If you do not specify a value, the trace output is sent to the default destination shown in the following table.

If the specified destination is not active or becomes inactive after you issue the START TRACE command, you receive message DSNW133I, which indicates that the trace data is lost. This applies for destinations GTF, SRV, and SMF. You also receive this message for destinations OP *n* and OPX if START TRACE is not issued by an application program.

Abbreviation: D

The allowable values and the default value depend on the type of trace started, as shown in the following table.

Table 25. Allowable destinations for each trace type

Type	GTF	SMF	SRV	OP <i>n</i>	OPX
PERFM	Default	Allowed	Allowed	Allowed	Allowed
ACCTG	Allowed	Default	Allowed	Allowed	Allowed
STAT	Allowed	Default	Allowed	Allowed	Allowed
AUDIT	Allowed	Default	Allowed	Allowed	Allowed
MONITOR	Allowed	Allowed	Allowed	Allowed	Default

The meaning of each value is as follows:

GTF

The z/OS generalized trace facility (GTF). The record identifier for records from Db2 is X'0FB9'.

SMF

The system management facility. The SMF record type of Db2 trace records depends on the IFCID record, as follows:

IFCID record

SMF record type

1 (System services statistics)

0100

2 (Database services statistics)

0100

3 (Agent accounting)

0101

202 (Dynamic system parameters)

0100

225 (System Storage® summary statistics)

0100

230 (Data sharing global statistics)

0100

239 (Package accounting)

0101

369 (Aggregate accounting statistics)

0100

All others

0102

SRV

An exit to a user-written routine. For instructions and an example of how to write such a routine, see the macro DSNWVSER in library *prefix* .SDSNMACS.

OP *n*

A specific destination.

n can be an integer from 1 to 8.

OPX

A generic destination which uses the first free OP *n* slot.

Only applications that start a trace to an OP *n* buffer can read that buffer.

All traces to an OPX destination must be stopped before the buffer is marked as not in use. Traces that are started to an OPX buffer that was formerly in use write over the storage any previous traces had set.

The constraint and filtering blocks

The constraint and filtering blocks place optional limits on the kinds of data that are collected by the trace. The filtering options are exclusionary equivalents to the corresponding constraint options.

Only the CLASS constraint option can be specified for starting a statistics trace. Any constraint option or filter option can be specified for starting all other trace types. However, Db2 does not use any filters or constraints that you specify when you start a trace for any of the following IFCIDs:

1	2	4	5	104	105	107	124	129	147
148	149	150	185	186	199	202	217	225	230
254	306	316	317	365	401	402			

A START TRACE command can contain multiple constraint options, multiple filtering options, or a combination of both. A constraint or a filtering option can contain multiple values. However, the command must not contain multiple constraint options that each contain multiple values. A single constraint option that has multiple values can be specified with:

- Multiple other constraint options, each of which has a single value
- Multiple filtering options, each of which has a single value or multiples values

An error message is issued if the START TRACE command contains two or more constraint options that each have multiple options.

The meaning of each option is as follows. Filtering options are described with their corresponding constraint options.

PLAN(*plan-name* , ...) or XPLAN(*plan-name* , ...)

Introduces a list of specific plans for which trace information is gathered. Use PLAN to constrain the trace to the specified plans or XPLAN to exclude the specified plans. You cannot use this option for a STAT trace.

The **default** is PLAN(*) .

(*)

Starts a trace for all plans.

plan-name

Is the name of an application plan. You can use up to eight names; a separate trace is started for each name. If you use more than one name, you can use only one value for AUTHID and LOCATION.

PKGLOC or XPKGLOC

Specifies the location name where the package is bound. Use PKGLOC to constrain the trace to the specified locations or XPKGLOC to exclude the specified locations.

PKGCOL or XPKGCOL

Specifies the package collection name. Use PKGCOL to constrain the trace to the specified collections or XPKGCOL to exclude the specified collections.

PKGPROG or XPKGPROG

Specifies the DBRM or program name. Use PKGPROG to constrain the trace to the specified programs or XPKGPROG to exclude the specified programs.

AUTHID(*authorization-id* , ...) or XAUTHID(*authorization-id* , ...)

Introduces a list of specific authorization IDs for which trace information is gathered. Use AUTHID to constrain the trace to the specified authorization IDs or XAUTHID to exclude the specified authorization IDs. The authorization IDs specified must be the primary authorization IDs. You cannot use this option for a STAT trace.

The **default** is AUTHID(***).

(*)**

Starts a trace for all authorization IDs.

authorization-id

Specifies an authorization ID. You can use up to eight identifiers; a separate trace is started for each identifier. If you use more than one identifier, you can use only one value for PLAN and LOCATION.

LOCATION(*location-name* , ...) or XLOC(*location-name* , ...)

Specifies a list of location names for which trace information is gathered. Use LOCATION to constrain the trace to the specified locations or XLOC to exclude the specified locations. The use of the LOCATION or XLOC option precludes tracing threads that have no distributed data relationship. LOCATION or XLOC cannot be specified when you want to start a statistics trace.

location-name

Identifies the Db2 subsystems whose distributed threads you want to trace. Activates the Db2 trace for the remote TCP/IP or SNA location that you specify by *location-name*.

You can specify up to eight locations; a separate trace is started for each one. You can specify only one location if you use more than one plan name or authorization ID.

<*luname*>

Activates the Db2 trace for the remote clients that are connected to DDF through the remote SNA LU name that you specified in *luname*.

ipaddr

Activates the Db2 trace for the remote clients that are connected to DDF through the remote TCP/IP host. *ipaddr* is the IP address.

The format of the IP address depends on whether the TCP/IP stack has been configured as an IPv4-only stack or a dual-mode stack. An IPv4 stack supports only the IPv4 protocol. A dual-mode stack supports IPv4 and IPv6 protocols.

- For an IPv4-only stack, you enter the IP address in IPv4 format:

```
x.x.x.x
```

- For a dual-mode stack:

- You enter an IPv6 address in IPv6 format:

```
y:y:y:y:y
```

- You enter an IPv4 address in dual IPv6 and IPv4 format, with ::FFFF: as the IPv6 portion:

```
::FFFF:x.x.x.x
```

(*)

Indicates that you want to start trace events that occur under distributed threads regardless of which location they are connected to. Specifying the local location name is equivalent to specifying LOCATION(*).

Clients other than Db2 for z/OS: Db2 for z/OS does not receive a location name from clients that are not Db2 for z/OS subsystems. To start a trace for a client that is not a Db2 for z/OS subsystem, enter its LUNAME or IP address. Enclose the LUNAME by the less-than (<) and greater-than (>) symbols. Enter the IP address in the form *nnn.nnn.nnn.nnn*. For example, to start a trace for a client with the LUNAME of LULA, enter the following command:

```
-START TRACE (PERFM) CLASS (*) LOCATION (<LULA>)
```

To start a trace for a client with the IP address of 123.34.101.98, enter the following command:

```
-START TRACE (PERFM) CLASS (*) LOCATION (: :FFFF:123.34.101.98)
```

USERID or XUSERID

Specifies the user ID. Use USERID to constrain the trace to the specified user IDs or XUSERID to exclude the specified user IDs. You can specify multiple values and wildcard values as described in [Usage notes](#).

USERID and XUSERID can be up to 16 characters.

APPNAME or XAPPNAME

Specifies the application name. Use APPNAME to constrain the trace to the specified applications or XAPPNAME to exclude the specified applications. You can specify multiple values and wildcard values as described in [Usage notes](#).

APPNAME and XAPPNAME can be up to 32 characters.

WRKSTN or XWRKSTN

Specifies the workstation name. Use WRKSTN to constrain the trace to the specified workstations or XWRKSTN to exclude the specified workstations. You can specify multiple values and wildcard values as described in [Usage notes](#).

WRKSTN and XWRKSTN can be up to 18 characters.

CONNID or XCONNID

Specifies the connection ID. Use CONNID to constrain the trace to the specified connections or XCONNID to exclude the specified connections.

The CONNID or XCONNID value is one of the following values:

CONNID value	Type of connection to Db2
BATCH	Batch
TSO	TSO
DB2CALL	QMF
UTILITY	Db2 utility
<i>subsystem-id</i>	Db2 internal
<i>cics-connection-name</i>	CICS
<i>ims-connection-name</i>	IMS
RRSAF	RRSAF
<i>connection-name</i>	A connection from a remote Db2 for z/OS requester. This value is the connection name of the thread at the requesting location.
SERVER	A connection from a remote requester that is not Db2 for z/OS.

CORRID or XCORRID

Specifies the correlation ID. Use CORRID to constrain the trace to the specified correlation IDs or XCORRID to exclude the specified correlation IDs.

ROLE or XROLE

Specifies the connection roles. Use ROLE to constrain the trace to the specified roles or XROLE to exclude the specified roles.

CLASS(*integer* , ...)

Introduces a list of classes of data gathered. What classes are allowable, and their meaning, depends on the type of trace started.

Abbreviation: C

When the CLASS option is omitted, the *default classes* within the trace type are activated. The default classes are identified in the Description column of the following tables.

(*)

Starts a trace for all classes of the trace type.

integer

Any number in the following table. You can use any number of classes that are allowed for the type of trace started.

Accounting trace (ACCTG)

Table 26. Classes for Db2 accounting trace

Class	Description of class	Activated IFCIDs
1	Standard accounting data. This default class is also activated when you omit the CLASS keyword from the START TRACE command when you start the accounting trace.	0003, 0106, 0200, 0239
2	Entry or exit from Db2 event signaling.	0232
3	Elapsed wait time in Db2.	0006-0009, 0032, 0033, 0044, 0045, 0117, 0118, 0127, 0128, 0170, 0171, 0174, 0175, 0213-0216, 0226, 0227, 0242, 0243, 0321, 0322, 0329, 0378, 0379, 0382, 0383, 0413, 0414
4	Installation-defined accounting record.	0151
5	Time spent processing IFI requests.	0187
6	Reserved.	
7	Package-level accounting in-Db2 time.	0200, 0232, 0239, 0240
8	Package-level accounting wait time in Db2.	0006-0009, 0032, 0033, 0044, 0045, 0117, 0118, 0127, 0128, 0170, 0171, 0174, 0175, 0213-0216, 0226, 0227, 0239, 0241-0243, 0321, 0322, 0378, 0379, 0382, 0383, 0413, 0414

Table 26. Classes for Db2 accounting trace (continued)

Class	Description of class	Activated IFCIDs
10	Package detail. One of the following traces must also be activated before the IFCID 0239 records are written: <ul style="list-style-type: none"> • Accounting class 7 • Accounting class 8 • Monitor class 7 • Monitor class 8 	0239
11	Plan-level accounting information. This class is activated when you omit the CLASS keyword from the START TRACE command when you start the accounting trace. Start a trace for accounting class 11 instead of accounting class 1 if you do not want IFCID 0239 records returned.	0003, 0200
12-29	Reserved.	
30 - 32	Available for local use.	

Audit trace (AUDIT)

Table 27. Classes for Db2 audit trace

Class	Description of class	Activated IFCIDs
1	Access attempts denied due to inadequate authorization. This default class is also activated when you omit the CLASS keyword from the START TRACE command when you start the audit trace.	0140
2	Explicit GRANT and REVOKE.	0141
3	CREATE, ALTER, and DROP operations against audited tables.	0142
4	First change of audited object.	0143
5	First read of audited object.	0144
6	Bind time information about SQL statements that involve audited objects.	0145
7	Assignment or change of authorization ID.	0055, 0083, 0087, 0169, 0319
8	Utilities.	0023, 0024, 0025, 0219, 0220
9	Installation-defined audit record.	146, 392
10	Trusted context information.	0269, 0270
11	Audits of successful access.	0361 “1” on page 482
12 - 29	Reserved.	
30 - 32	Available for local use.	

Table 27. Classes for Db2 audit trace (continued)

Class	Description of class	Activated IFCIDs
-------	----------------------	------------------

Notes:

1. If IFCID 0361 is started through START TRACE, all successful access is traced. If IFCID 0361 is started because audit policy category SYSADMIN is on, only successful access using the SYSADMIN administrative authority is traced. If IFCID 0361 is started because audit policy category DBADMIN is on, only successful access using the DBADMIN administrative authority is traced.

Statistics trace (STAT)

Table 28. Classes for Db2 statistics trace

Class	Description of class	Activated IFCIDs
1	Information about system services, database statistics, statistics for the DBM1 address space, and information about the system parameters that were in effect when the trace was started. This default class is also activated when you omit the CLASS keyword from the START TRACE command when you start the statistics trace.	0001, 0002, 0105, 0106, 0202, 0225
2	Installation-defined statistics record	0152
3	Deadlock, lock escalation, group buffer pool, data set extension information, and indications of long-running uncommitted reads, and active log space shortages.	0172, 0196, 0250, 0258, 0261, 0262, 0313, 0330, 0337
4	Db2 exceptional conditions.	0173, 0191-0195, 0203-0210, 0235, 0236, 0238, 0267, 0268
5	Db2 data sharing statistics record.	0230
6	Storage statistics for the Db2 subsystem.	0225
7	DRDA location statistics.	0365
8	Data set I/O statistics.	0199, 0389
9	Aggregated CPU and wait time statistics by connection type.	0369
10 - 29	Reserved.	
30 - 32	Available for local use.	

Performance trace (PERFM)

Table 29. Classes for Db2 performance trace

Class	Description of class	Activated IFCIDs
1	Background events. This default class is also activated when you omit the CLASS keyword from the START TRACE command when you start the performance trace.	0001, 0002, 0031, 0042, 0043, 0076-0079, 0102, 0103, 0105-0107, 0153

Table 29. Classes for Db2 performance trace (continued)

Class	Description of class	Activated IFCIDs
2	Subsystem events. This default class is also activated when you omit the CLASS keyword from the START TRACE command when you start the performance trace.	0003, 0068-0075, 0080-0089, 0106, 0174, 0175
3	SQL events. This default class is also activated when you omit the CLASS keyword from the START TRACE command when you start the performance trace.	0022, 0053, 0055, 0058-0066, 0092, 0095-0097, 0106, 0112, 0173, 0177, 0233, 0237, 0250, 0272, 0273, 0325
4	Reads to and writes from the buffer and EDM pools.	0006-0010, 0029-0030, 0105-0107, 0127, 0128, 0226, 0227, 0321, 0322, 0477
5	Write to log; archive log.	0032-0041, 0104, 0106, 0114-0120, 0228, 0229
6	Summary lock information.	0020, 0044, 0045, 0105-0107, 0172, 0196, 0213, 0214, 0218, 0337
7	Detailed lock information.	0021, 0105-0107, 0223
8	Data scanning detail.	0013-0018, 0105-0107, 0125, 0221, 0222, 0231, 0305, 0311, 0363
9	Sort detail.	0026-0028, 0095-0096, 0106
10	BIND, commands, and utilities detail.	0023-0025, 0090, 0091, 0105-0107, 0108-0111, 0201, 0256
11	Execution unit switch and latch contentions.	0046-0052, 0056, 0057, 0093, 0094, 0106, 0113
12	Storage manager.	0098-0101, 0106
13	Edit and validation exits.	0011, 0012, 0019, 0105-0107
14	Entry from and exit to an application.	0067, 0106, 0121, 0122
15	Installation-defined performance record.	0154
16	Distributed processing.	0157-0163, 0167, 0183
17	Claim and drain information.	211-216
18	Event-based console messages.	0197
19	Data set open and close activity.	0370, 0371
20	Data sharing coherency summary.	0249-0251, 0256-0257, 0261, 0262, 0267, 0268
21	Data sharing coherency detail.	0255, 0259, 0263
22	Authorization exit parameters.	0314
23	Language environment runtime diagnostics.	0327
24	Stored procedure detail.	0380, 0499
25-29	Reserved.	
30 - 32	Available for local use.	

Monitor trace (MONITOR)

Table 30. Classes for Db2 monitor types

Class	Description of class	Activated IFCIDs
1	Standard accounting data. This default class is also activated when you omit the CLASS keyword from the START TRACE command when you start the monitor trace.	0200
2	Entry or exit from Db2 event signaling.	0232
3	Db2 wait time for I/O, locks; resource usage information.	0006-0009, 0032, 0033,0044, 0045, 0117, 0118, 0127, 0128, 0170, 0171, 0174, 0175, 0213,0 214, 0215, 0216, 0226, 0227, 0242, 0243, 0321, 0322, 0378, 0379, 0382, 0383, 0413, 0414
4	Installation-defined monitor record.	0155
5	Time spent processing IFI requests.	0187
6	Changes to tables created with DATA CAPTURE CHANGES.	0185
7	Entry or exit from Db2 event signaling for package accounting. The data traces the amount of time an agent spent in Db2 to process each package.	0200, 0232, 0240
8	Wait time for a package.	0006-0009, 0032, 0033, 0044, 0045, 0051, 0052, 0056, 0057, 0117, 0118, 0127, 0128, 0170,171,174, 175, 213-216, 226, 227, 239, 241-243, 321, 322, 0378, 0379, 0382, 0383, 0413, 0414
9	Enables statement level accounting.	0124
10	Package detail for buffer manager, lock manager and SQL statistics. One of the following traces must also be activated before the IFCID 0239 records are written: <ul style="list-style-type: none"> • Accounting class 7 • Accounting class 8 • Monitor class 7 • Monitor class 8 	0239
11	Plan-level accounting information. This class is activated when you omit the CLASS keyword from the START TRACE command when you start the monitor trace.	0003, 0200
12-28	Reserved.	
29	Controls the subsystem-wide collection of statistics for SQL statements.	0316 , 0318, 0400, 0401
30 - 32	Available for local use.	

IFCID (*ifcid* , ...)

Specifies which other IFCIDs (trace events), in addition to those IFCIDs contained in the classes specified in the CLASS option, are to be started. To start only those IFCIDs specified in the IFCID option, use trace classes 30-32. These classes have no predefined IFCIDs and are available for a location to use. See [Example 1](#) for an example of activating only those trace events specified in the IFCID option.

If you do not specify the IFCID option, only those IFCIDs contained in the activated trace classes are started.

The maximum number of IFCIDs is 156. The range of values that are valid for the IFCID option is 0001 through 0511, with the exceptions of: 0004, 0005, 0185, 0187, 0217, 0232, 0234, 0240, 0241, and 0362. These exceptions are invalid values for the IFCID option. IFCIDs 4 and 5 are always automatically active. IFCID 0362 is automatically started if you specify the AUDTPLCY option. Some of the other invalid IFCIDs can be activated only by certain trace classes. The invalid values for the IFCID option that can be started only by trace classes are:

To start...**Start...****IFCID 0185**

monitor trace class 6

IFCID 0232

monitor trace class 2 or 7, or accounting trace class 2 or 7

IFCID 0240

monitor trace class 7 or accounting trace 7

IFCID 0241

monitor trace class 8 or accounting trace 8

The **default** is IFCID (*) .

BUFSIZE (*k_bytes* , ...)

Specifies the size of an IFC managed buffer that receives the trace data. You can specify this option only if you specified an OP *n* destination.

k_bytes can range from 256 KB to 65536 KB. The number must be evenly divisible by 4. If you specify a value outside of this range, the range limit closest to the specified value is used. To allocate a buffer size of 256 KB, you would specify BUFSIZE(256).

The **default** is BUFSIZE (*), which is the size set when Db2 was installed.

AUDTPLCY(*policy-name* , ...)

Introduces a list of up to eight audit policy names for which trace information is gathered. This option starts the IFCIDs that correspond to the categories that are specified in the listed audit policies, and starts a trace for IFCID 0362.

AUDTPLCY applies to trace type AUDIT. You cannot specify AUDTPLCY with CLASS or IFCID.

TDATA

Specifies the product section headers to be placed into the product section of each trace record. If you do not specify TDATA, then the type of trace determines the type of product section header. The product section of a trace record can contain multiple headers.

All IFC records have a standard IFC header. The correlation header is added for accounting, performance, audit, and monitor records. The trace header is added for serviceability records.

CORRELATION

Places a correlation header on the record.

Abbreviation: COR

TRACE

Places a trace header on the record.

Abbreviation: TRA

CPU

Places a CPU header on the record. The CPU header contains the current processor time for the z/OS TCB or SRB executing.

DISTRIBUTED

Places a distributed header on the record.

Abbreviation: DIST

Usage notes

Audit policies: Up to 32 audit policies can be active concurrently. If you specify multiple audit policies to start, and some of those policies do not start successfully, warning message DSNW196I is returned. The remaining audit policies are started.

Recommendation: [FL 509](#) Start all tamper-proof audit policies in one START TRACE command, which assigns them to one trace number. Doing so helps avoid the possibility of mismatching trace numbers among data sharing members if the SCOPE(GROUP) option is used to stop a tamper-proof audit policy.

Number of traces: If you use one or no values for PLAN, AUTHID, or LOCATION, the START TRACE command starts a single trace. If you use multiple values for PLAN, AUTHID, or LOCATION, the command starts a trace for each plan, authorization ID, or location. Up to 32 traces can be active concurrently. If a START TRACE command is entered from the console or from the DB2I panels to an OP *n* or an OPX destination, message DSNW133I is issued to indicate trace data lost.

Using the options PLAN, AUTHID, or LOCATION when starting monitor trace class 1 has no effect on the amount of data returned on IFI READS requests.

Using the options PLAN, AUTHID, or LOCATION has no effect when starting either accounting or monitor trace classes 2, 5, or 7.

Stopping and starting Db2: If Db2 is stopped and started after you have started a trace, the trace is not restarted automatically.

Specifying SCOPE (GROUP): When you issue START TRACE with SCOPE(GROUP), Db2 issues a START TRACE command on each member of the data sharing group. The data goes to the destination as it is defined for each member of the data sharing group. If you want to gather trace data for all members of the data sharing group in one place, use a monitor program with IFI READA or READS calls to collect the data.

[FL 509](#) If you use the SCOPE(GROUP) option to specify multiple audit policies to start, the audit policies are sent to all members of the data sharing group. However, if one of the specified audit policies is a tamper-proof audit policy, the tamper-proof audit policy is blocked for all members of the data sharing group. You cannot use SCOPE(GROUP) to start tamper-proof audit policies.

If a trace is started with SCOPE(GROUP), and a new member joins the data sharing group after the trace is started, the new member also writes the trace data that is specified by the START TRACE command.

Starting a trace with SCOPE(GROUP) can generate large amounts of trace data, so you might need to increase the size of the return area in your monitor program to hold the extra data.

Tracing threads using the * wildcard in a partial name or address: In a partial name or address, you can use the wildcard suffix, "*" to filter threads. For example, if you specify "-START TRACE PLAN (A,B,C*)", Db2 will trace, and then return A, B, CDE, CDEFG, CDEFGH, and so on. It will trace threads "A", "B" and all threads starting with "C".

You cannot include the wildcard character in the middle of a partial name or address.

Tracing threads using the positional, () wildcard in a partial name or address: In a partial name or address, you can use the positional wildcard, which is represented by the, "_" character, to trace threads when you want the wildcard in the middle, or when you want to trace threads of a specific length. For example, if you specify "-START TRACE PLAN (A_C)", all threads will be traced that are three characters that have "A" as the first character, and "C" as the third. This command would return "ABC", "ADC", "AEC", and so on. If you want to trace the thread "A_C" then you can specify "-START TRACE PLAN (A/_C)". The "/" before the "_" tells Db2 to trace for the underscore in the search, rather than treating it as a wildcard. The same logic applies if you are trying to trace a thread that includes a "/" or "*" character. Because

the character “/” is an escape character, if you are trying to trace a thread that has an “/” character in it, you can specify, for example, “-START TRACE PLAN (A//C)” to trace the thread “A/C”. You can also specify “-START TRACE PLAN (A/*C)” to trace the thread “A*C”.

Tracing multiple threads at once using wildcards: You also have the option of tracing multiple threads based on multiple trace qualifications. For example, you can specify, “-START TRACE PLAN (A*, B*, C*)” to simultaneously trace ALL threads for plan that start with “A”, “B”, and “C”. The wildcard character, “*” will trace all threads. You can specify more complex combinations such as, “-START TRACE PLAN (A_B*, C*, AND C/_D*)”, which will return all threads that:

- Begin with “A”, have a one character wild card as the second character in the thread, have a “B” as the third character in the thread, and end with any type or number of characters (**ADBIOP**, **AOBTYJDP**),
- begin with “C”, and end with any combination of characters (**CDE**, **CGHKO**)
- begin with “C_D” and end with any type of character combination (**C_DEFGH**, **C_DLMNOP**)

All of the possible thread combinations listed above will be returned with the command above.

Specifying filtering criteria for threads: You can control the set of threads for which trace records are written by setting specific filtering criteria in the -START TRACE command. The following rules apply to **all** trace filters:

- Db2 applies trace filters when an external trace record is written. The state of a thread at that time dictates whether a thread is written in its entirety or eliminated completely.
- Trace filters do not alter the contents of a trace record.
- Trace classes or IFCIDs that are not associated with specific trace records, such as accounting classes 2, 3, 7, 8, and 10, or IFCID 0318, are not affected by filtering. For example, the following command does not result in filtering because no external records are written by accounting classes 7 or 8:

```
-START TRACE(ACCTG) CLASS(7,8) DEST(SMF) PKGPROG(ABC)
```

- Db2 allows only one filtering option to have more than one value in a -START TRACE command. For example, the following command is valid:

```
-START TRACE PLAN(A,B) USERID(B) WRKSTN(E)
```

The following command is not valid:

```
-START TRACE PLAN(A,B) USERID(A,B) WRKSTN(E)
```

Filtering threads using exclude functionality: When you specify an “X” with any constraint keyword, such as XPLAN, when you are filtering threads, you are using the exclude functionality for the -START TRACE command. You have the option of excluding specific types of threads when you are running trace commands. You can use the “X” character to exclude specific combinations of characters when you are running a trace. For example, you can specify this command to trace all threads except “A”:

```
-START TRACE XPLAN(A)
```

In this instance, b, bcd, bcde, or cd might be returned.

You can also exclude multiple types of threads from your trace. For example, you can specify this command to start a trace for all threads **except** threads for plans that start with “A”, with any combination of characters following “A”, and all those characters starting with “B”, with any combination of characters following “B”:

```
-START TRACE XPLAN(A*, B*)
```

Specifying XPLAN (*) excludes all threads from your search, and is not allowed. You also cannot use the * wildcard in the middle of trace criteria with exclude functionality, such as: “-START TRACE XPLAN (A*C).”

You can, however, specify this command to return all threads **except** those for plans that start with “A”, any **two** characters next, a “C” in the fourth space, and any characters at the end.

```
-START TRACE XPLAN (A_ _ C *)
```

You can start two traces at once, in order to help you optimize your tracing capabilities. For example, you can specify this command:

```
-START TRACE XPLAN (A, B, C) USERID(D)
```

This command tells Db2 to start tracing threads for all plans **except** plans “A”, “B”, or “C”, and only where the user ID = “D”.

Combining trace qualifiers: You can customize the threads you trace by commanding Db2 to trace specific threads, while excluding other specific threads. For example, you can specify, “-START TRACE USERID (A,B) XPLAN (C)” . This criteria only traces threads where the user ID is equal to “A” or “B”, and plan is **not** equal to “C”. In this example, a thread where the user id is “A” and the plan is equal to “D” would pass, and be traced, but a thread where the user ID is “A” and plan is “C” would not pass, and would not be traced.

You can introduce multiple wildcards into your start trace commands to add more customization to your traces. For example, you can specify “-START TRACE PLAN (C*) USERID (Z, X) XPLAN (C, D, E)”. In this example, for the thread to be traced, the plan must begin with C, the user ID must be equal to Z or to X, and the plan cannot be C, D, or E. So a plan of CB, with a user ID of Z would pass, and the thread would be traced, but plan C with a user ID of X would fail because the command specifies not to trace threads where the plan is “C”, without additional characters in the thread.

Trace destination precedence: If an IFCID is associated with a class, and you specify that IFCID in the IFCID keyword, the destination for the class takes precedence. This rule affects IFCIDs in accounting classes 2, 3, 5, 7, 8, and monitoring classes 1, 2, 3, 5, 7, 8 because these classes have preset destinations for the IFCIDs.

For example, the following command “-START TRACE(ACCTG) CLASS (1,2,3) IFCID(6,7) DEST SMF,” will not write IFCIDs 6 and 7 to SMF because they are part of accounting class 3, which has a preset destination. To write IFCIDs 6 and 7 to SMF, you need to start the trace as follows:

```
-START TRACE(ACCTG) CLASS(1,2,3) DEST(SMF)
-START TRACE(ACCTG) CLASS(30) IFCID(6,7) DEST(SMF)
```

IFCIDs for local use: IFCIDs 1000 through 1999 are not used by Db2, and are available for local use.

Examples

Example: Start a performance trace for threads with remote activity to location USIBMSTODB21. Only activate IFCIDs 0044 (lock suspends) and 0045 (lock resumes). Trace class 30 is available for installation use.

```
-START TRACE (PERFM)
  DEST(GTF)
  LOCATION(USIBMSTODB21)
  CLASS(30)
  IFCID(44,45)
```

Example: Start an accounting trace for plan DSN8BC81. Write records to SMF (that will happen by default). Include a comment to identify the trace.

```
-START TRACE (ACCTG)
  PLAN (DSN8BC81)
  COMMENT ('ACCTG TRACE FOR DSN8BC81')
```

Example: Start the statistics trace. Write records to SMF (by default).

```
-START TRACE=S
```

Example: Start monitor tracing (usually done by an application program). Write records to OPX (by default).

```
-START TRACE(MON)
```

Example: Start monitor tracing (usually done by an application program) on the data sharing group. Write records to OPX (by default).

```
-START TRACE(MON) SCOPE(GROUP)
```

Example: Use the PKGPROG option to write performance trace records only for threads that are executing package ABC during the SQL event that causes the trace record to be externalized.

```
-START TRACE(PERFM) CLASS(3) DEST(SMF) PKGPROG(ABC)
```

Example: Start an accounting trace to activate package-level accounting and to collect data that is externalized by IFCID 0003 and IFCID 0239. Use the PKGPROG option to externalize accounting information that is written when accounting records for package ABC are written.

```
-START TRACE(ACCTG) CLASS(1,2,3,7,8) DEST(SMF) PKGPROG(ABC)
```

The externalized records contain information for **all** packages that are executed during the accounting interval.

Example: Provide IFC exclude filtering for correlation ID.

```
START TRACE (A) XCORRID (*)
- 10.46.05 STC00051 DSNW150I ) EXCLUDE FOR ALL CORRID VALUES IS NOT
- ALLOWED
- 10.46.05 STC00051 DSN9023I ) DSNWVCM1 '-START TRACE' ABNORMAL COMPLETION
```

Example: Start an audit trace using audit policy AUDITADMIN.

```
-STA TRACE(AUDIT) DEST(GTF) AUDTPLCY(AUDITADMIN)
```

Related tasks

[Minimizing the processing cost of Db2 traces \(Db2 Performance\)](#)

Related reference

[-STOP TRACE \(Db2\)](#)

The Db2 command STOP TRACE stops tracing.

[-MODIFY TRACE \(Db2\)](#)

The Db2 command MODIFY TRACE changes the IFCIDs (trace events) associated with a particular active trace.

[-DISPLAY TRACE \(Db2\)](#)

The Db2 command DISPLAY TRACE displays a list of active traces.

Chapter 85. -STOP ACCEL (Db2)

The Db2 command STOP ACCEL causes the Db2 subsystem to stop using the specified accelerator servers.

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program that uses the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the SCOPE option.

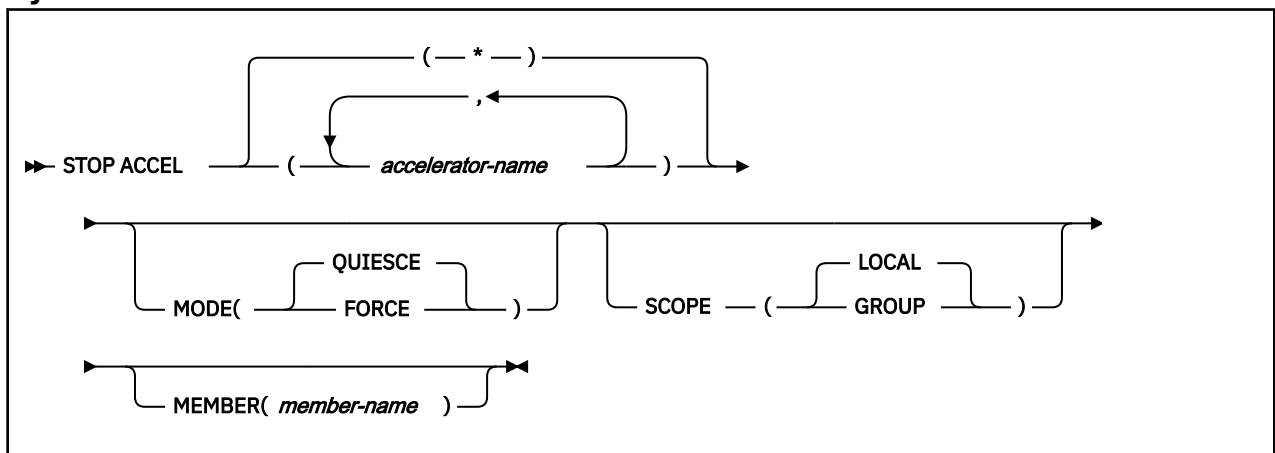

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization by using primary and secondary authorization IDs.

Syntax

Option descriptions

(*accelerator-name*)

The accelerator server name. This option limits the stop command to the specified accelerator server.

(*)

Indicates that the stop command applies to all accelerator servers.

MODE

Indicates whether currently executing active accelerator threads are allowed to complete. Valid values are:

(QUIESCE)

Allows active accelerator threads to complete normally and terminates only inactive accelerator threads.

(FORCE)

Terminates all currently executing accelerator threads. Db2 reverts to baseline processing for the originating threads.

SCOPE

Specifies the scope of the command. In a non-data-sharing environment, the option is ignored. Valid values are:

(LOCAL)

Stops the current data sharing member from using the specified accelerator servers. This is the default.

(GROUP)

Stops the data sharing group from using the specified accelerator servers.

MEMBER

Stops specific members of the data sharing group from using the specified accelerator servers. The default behavior is to stop accelerator servers on the local member. This option is not supported in non-data sharing environments.

Usage notes

If you specify both SCOPE(GLOBAL) and MEMBER(*member-name*), the command will be executed only on the specified members of the data sharing group.

Example

The following command is used to stop the current data sharing member from using all accelerators, and to terminate only inactive accelerator threads.

```
-STOP ACCEL(*) MODE(QUIESCE) SCOPE(LOCAL)
```

Sample results follow:

```
DSNX863I ) DSNX8ST0 STOP ACCELERATOR INITIATED FOR BLINK1
DSNX863I ) DSNX8ST0 STOP ACCELERATOR INITIATED FOR BLINK2
DSNX861I ) DSNX8CXA ALL OTHER ACCELERATORS STOPPED
DSNX9022I ) DSNX8CMD '-STOP ACCEL' NORMAL COMPLETION
DSNX870I ) DSNX8EKG ACCELERATOR BLINK1 IS NOT ONLINE
DSNX860I ) DSNX8EKG STOP ACCELERATOR SUCCESSFUL FOR BLINK1
DSNX870I ) DSNX8EKG ACCELERATOR BLINK2 IS NOT ONLINE
DSNX860I ) DSNX8EKG STOP ACCELERATOR SUCCESSFUL FOR BLINK2
```

Related information

[IBM Db2 Analytics Accelerator for z/OS documentation](#)

Chapter 86. STOP admtproc (z/OS)

The STOP *admtproc* command stops the administrative task scheduler that is specified in the *admtproc* parameter.

The command should only be issued to bring down the administrative task scheduler for maintenance or to prepare for an IPL. To stop the administrative task scheduler for other purposes, issue the command: `modify admtproc, appl=shutdown`.

Environment

This command can be issued only from a z/OS console.

Data sharing scope: Member

Authorization

The command requires an appropriate level of operating system authority.

Syntax

➤ STOP — *admtproc* ➤

Option descriptions

admtproc

Specifies the procedure name of the administrative task scheduler task that you want to stop.

Examples

Example: This command stops the *admtproc* scheduler.

Enter the following command on the system console:

```
stop admtproc
```

Chapter 87. -STOP CDDS (Db2)

The Db2 command STOP CDDS makes the compression dictionary data set (CDDS) unavailable, and directs all members of a Db2 data sharing group to close and deallocate the CDDS.

Abbreviation: -STO CDDS

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program that uses the instrumentation facility interface (IFI).

This command must be issued from the source or proxy data sharing group in an implementation of the GDPS Continuous Availability with zero data loss solution.

Data sharing scope: Group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- BSDS privilege
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

►► STOP CDDS ◄◄

Usage notes

Before you can recover a logically damaged CDDS without bringing down its data sharing group, you need to issue -STOP CDDS. See [Recovering the compression dictionary data set without bringing down a Db2 data sharing group \(Db2 Administration Guide\)](#) for more information.

Examples

Example: Making the CDDS unavailable to all members of a source data sharing group

Issue this command:

```
-STOP CDDS
```

If the command is successful, output like this is displayed:

```
DSNJ375I - DSNJB101 CDDS DSNNAME = cdds-name IS INACTIVE IN SOURCE  
MODE.  
  
DSN9022I - DSNJC001 'STOP CDDS' NORMAL COMPLETION
```

Related tasks

[Reading complete log data for the GDPS Continuous Availability with zero data loss solution \(Db2 Administration Guide\)](#)

Chapter 88. -STOP DATABASE (Db2)

The Db2 command STOP DATABASE makes the specified objects unavailable for applications and closes their data sets.

The objects that can be designated are:

- Databases
- Table spaces
- Index spaces
- Physical partitions of partitioned table spaces or index spaces (including index spaces that contains data-partitioned secondary indexes)
- Logical partitions of nonpartitioned secondary indexes

When used to stop a logical partition of a secondary index, the command does not close any data sets that are associated with the index.

In a data sharing environment, the command applies to every member of the data sharing group. If a GBP-dependent object is stopped with the command STOP DATABASE, Db2 performs the necessary processing to make the object no longer GBP-dependent.

Abbreviation: -STO DB

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- STOPDB privilege
- DBMAINT authority
- DBCTRL authority
- DBADM authority
- System DBADM authority
- SYSCTRL authority
- SYSADM authority

Error messages are produced for those specified databases for which this set does not have the STOPDB privilege.

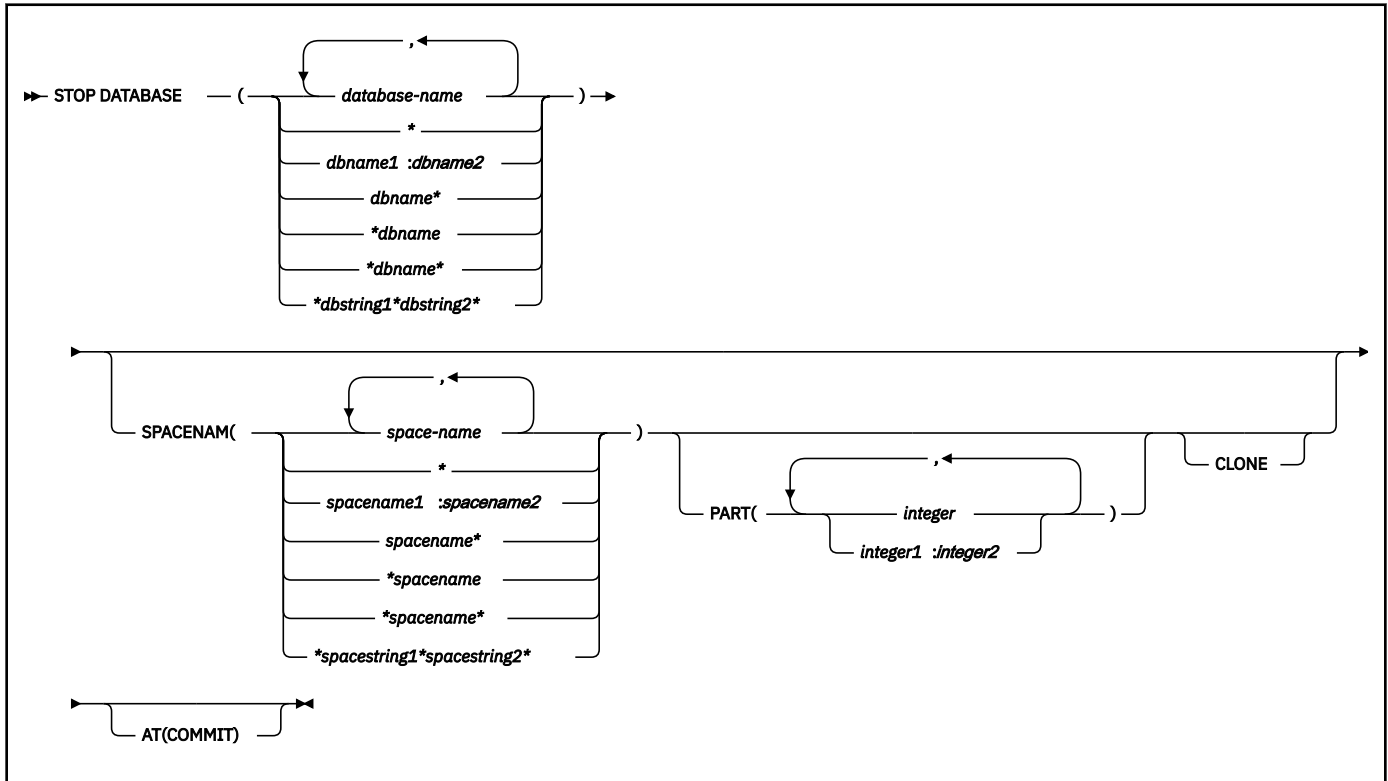

For implicitly created databases, the database privilege or authority can be held on the implicitly created database or on DSND04. If the STOP DATABASE command is issued on specific table spaces or index spaces in an implicitly created database, ownership of the table spaces is sufficient to stop them. This means that the owner can display information about an implicitly created table space or index space if the command explicitly specifies that table space or index space name.

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

When data definition control is active, installation SYSOPR or installation SYSADM authority is required to stop the database, a table space, or an index space that contains a registration table or index.

Database DSNCDB06 contains the table spaces and index spaces that are required to check authorization. If you stop any table space or index space that is required for the START DATABASE authorization check, installation SYSADM authority is required to restart it.

Syntax

Option descriptions

One of the following two options is required.

(*database-name* , ...)

Specifies the names of the database, or database for the table spaces or index spaces to stop. The following variations are accepted:

(*database-name* , ...)

Identifies one or more database names, separated by commas or blanks.

(*)

All databases that are defined to the Db2 subsystem for which the privilege set of the process has the required authorization.

(*dbname1:dbname2*)

All databases whose names, in UNICODE, are between *dbname1* and *dbname2* inclusive.

(*dbname**)

All databases whose names begin with the string *dbname* that contains 1 - 7 characters.

(**dbname*)

All databases whose names end with the string *dbname* that contains 1 - 7 characters.

(**dbname**)

All databases whose names contain the string *dbname*, where *dbname* that contains 1 - 6 characters.

(**dbstring1*dbstring2**)

All databases whose names contain the strings *dbstring1* and *dbstring2* that together contain a total of 2 - 5 characters.

SPACENAM(*space-name* , ...)

Indicates names of table spaces or indexes within the specified database to stop.

Abbreviation: SPACE, SP

space-name

Is the name of one or more table spaces or index spaces to stop. The following variations are accepted: *spacename* and *spacestring* can have any of the forms in the following list (where *spacename1* and *spacename2* represent any strings of from 1 to 8 characters, and *spacename* represents any string of from 1 to 7 characters):

(*spacename*, ...)

One or more index space names, separated by commas or blanks.

(*)

All table spaces or index spaces that are defined to the Db2 subsystem for which the privilege set of the process has the required authorization.

(*spacename1:spacename2*)

All table spaces or index spaces whose names, in UNICODE, are between *spacename1* and *spacename2* inclusive

(*spacename)**

All table spaces or index spaces whose names begin with the string *spacename* that contains 1 - 7 characters.

(spacename*)**

All table spaces or index spaces whose names end with the string *spacename* that contains 1 - 7 characters.

(spacename**)**

All table spaces or index spaces whose names contain the string *spacename* that contains 1 - 6 characters.

(spacestring1*spacestring2**)**

All table spaces or index spaces whose names contain the strings *spacestring1* and *spacestring2* that together contain a total of 2 - 5 characters.

PART (*integer* , ...)

Indicates the partition number of one or more partitions, within the specified table space or index, that are to be stopped. The START or STOP state of other partitions does not change.

The *integer* specified must identify a valid partition number for the corresponding space name and database name. If you specify nonvalid partition numbers, you receive an error message for each nonvalid number, but all valid partitions that you specified are stopped.

integer can be written to designate one of the following specifications:

- A list of one or more partitions
- A range of all partition numbers that collate greater than or equal to *integer1* and less than or equal to *integer2*
- A combination of lists and ranges

PART is valid with partitioned table spaces, partitioned indexes, and nonpartitioned type 2 indexes of partitioned table spaces. If you specify PART with a nonpartitioned table space or index on a nonpartitioned table space, you receive an error message, and the nonpartitioned space is not stopped. When a logical partition is stopped, the index is not closed. A nonpartitioning index must be stopped without the use of PART to close the index.

CLONE

Stops clone objects. In the absence of the CLONE keyword, base table objects are stopped and clone table objects are not processed. If you specify the CLONE keyword then only clone objects will be processed.

AT(COMMIT)

Marks the specified object as being in STOP status to prevent access from new requesters. Currently running applications are allowed to continue access until their next commit. After commit, further access by the committing application is prohibited. The object is actually stopped and put in STOP status when all jobs release their claims on it and all utilities release their drain locks on it. Specify AT(COMMIT) to break in on threads that are bound with RELEASE(DEALLOCATE), especially in situations where there is high thread reuse.

The option is ignored for declared temporary databases and table spaces within it.

Usage notes

Explicitly stopped databases: If table spaces and indexes are stopped explicitly (using the STOP DATABASE command with the SPACENAM option), they must be started explicitly using the START DATABASE command. Starting the database does not start table spaces or indexes that have been stopped explicitly.

Stopped table spaces, indexes, and partitions: Table spaces, indexes, and partitions are physically closed when the STOP DATABASE command is issued, except for logical partitions of a nonpartitioning index of a partitioned table space. Index spaces for declared temporary tables cannot be stopped or started.

Operation in TSO, z/OS, and batch: When the STOP DATABASE command is issued from a TSO or a z/OS console, the command operates asynchronously to keep the terminal free. When the command is issued from a batch job, it operates synchronously in case later steps depend on the database being stopped. The STOP DATABASE command drains work in progress on the database before stopping it. If it cannot get the drain locks on the first request, it repeatedly tries again. The command fails if it times out more than 15 times trying to get the locks or if a serious deadlock situation occurs.

Ensuring that all databases are stopped: When the STOP DATABASE command is processing asynchronously, message DSN9022I might be issued before the command completes. Message DSNT736I is issued to indicate that the asynchronous processing of the STOP DATABASE command is complete.

Use the DISPLAY DATABASE command to check the stopped status of table spaces and indexes in a database. A status of STOPP indicates that the object is in the process of being stopped. A status of STOP indicates that the stop has completed and the object is in a stopped state. An object is not stopped until all currently active threads accessing the object are quiesced.

An object might remain in the STOP pending (STOPP) status if the STOP DATABASE command does not successfully complete processing.

Stopping the communication database and the resource limit database: If the communication database (CDB) and the resource limit database (RLST) are active, they cannot be stopped. Those databases are active when created and are activated by Db2.

Stopping the SYSCONTX catalog table space or indexes on tables in the SYSCONTX catalog table space: If trusted contexts are in use when you stop SYSCONTX or the associated indexes, you can continue to use any trusted contexts that are already defined.

Stopping DSNDB01: If you try to stop the DSNDB01 database while an application plan or package is executing, you might receive a time out because of locking contention on DSNDB01. This is most likely to occur when an application plan or package is executing for the first time since Db2 was started, or if the skeleton cursor table (SKCT) for the plan or the skeleton package table (SKPT) for the package was swapped out of the EDM pool.

Table space in a restrictive status: If an application process requests a transaction lock on a table space that is in a restrictive status (RECP) or has a required index in a restrictive status, Db2 acquires the lock and does not detect the status until the application tries to access the table space or index. The application then receives SQLCODE -904 ("resource not available") and should release the lock, either by committing or rolling back (if the value of the RELEASE option is COMMIT) or by ending (if the value of RELEASE is DEALLOCATE). If you issue the command STOP DATABASE for either the table space or the index space while a transaction lock is in effect, the command is suspended. It repeatedly tries to get the

locks needed to drain the work in progress before stopping the database. If the command times out more than 15 times trying to get the locks, it fails.

Stopping a table space partition in PRO restricted status: When a table space that is in Persistent Read Only (PRO) restricted status is stopped, the partition remains in PRO restricted status.

After a disk failure: Issuing the STOP DATABASE command before interrupting the I/O interface between the failed device and Db2 can result in incomplete I/O requests. To prevent this hang situation, create an interruption either by forcing the device offline using the z/OS command VARY with the FORCE option, or by setting the I/O timing interval for the device before any failures. You can set the I/O timing interval through the IECIOSxx z/OS parmlib member or by issuing the z/OS command:

```
SETIOS MIH,DEV=dddd,IOTIMING=mm:ss
```

Stopping a LOB table space: The STOP DATABASE command can be used to stop LOB table spaces and indexes on auxiliary tables. LOB table spaces are stopped independently of the base table space with which the LOB table space is associated.

The following table summarizes the locking used by the STOP DATABASE command.

Table 31. Locking used by the STOP DATABASE command

Command	Table space type		Locks acquired
STOP AT COMMIT	Partitioned	PART	IX mass delete lock. Drain-all on partitions specified.
			IX mass delete lock. Drain-all on all partitions.
	Nonpartitioned		IX mass delete lock. Drain-all on table space.
STOP	Partitioned	PART	X-lock partitions specified. Drain-all on partitions specified.
			X-lock all partitions. Drain-all on all partitions.
	Nonpartitioned		X-lock table space. Drain-all on table space.

Examples

Example 1: Stop table space DSN8S81E in database DSN8D81A and close the data sets that belong to that table space.

```
-STOP DATABASE(DSN8D81A) SPACENAM(DSN8S81E)
```

Example 2: Stop all databases (except DSNDB01, DSNDB06, and work file databases)

```
-STOP DATABASE(*)
```

Example 3: Stop all databases (except DSNDB01, DSNDB06, and work file databases) when all jobs release their claims and all utilities release their drain locks.

```
-STOP DATABASE(*) AT(COMMIT)
```

Example 4: Stop the first partition of XEMP2, a nonpartitioning index of a partitioned table space in database DSN8D81A. Partition 1 is logically stopped and cannot be accessed by applications; however, no data sets are closed because parts of a nonpartitioning index are not associated with separate physical data sets.

```
-STOP DATABASE(DSN8D81A) SPACENAM(XEMP2) PART(1)
```

Example 5: Stop all table spaces with names that begin with "T" and end with the "IQUA03" string in database DSN8D81A.

```
-STOP DATABASE(DSN8D81A) SPACENAM(T*IQUA03)
```

Output similar to the following output indicates that the command completed successfully:

```
DSN9022I - DSNTDDIS 'STOP DATABASE' NORMAL COMPLETION  
DSNT736I - ASYNCHRONOUS STOP DATABASE COMMAND HAS  
COMPLETED FOR COMMAND: STOP DB(DSN8D81A) SPACE(T*IQUA03)
```

Example 6: Stop clone objects.

```
-STOP DATABASE(MYDB*) SPACENAM(MYDB*SP) CLONE
```

Chapter 89. -STOP DB2 (Db2)

The Db2 command STOP DB2 stops the Db2 subsystem.

Abbreviation: -STO DB2

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- STOPALL privilege
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

MODE

Indicates whether currently executing programs will be allowed to complete. For the effects of this option on distributed threads see the description of the MODE option of [Chapter 90, “-STOP DDF \(Db2\),” on page 505](#).

(QUIESCE)

Allows currently executing programs to complete processing. No new program is allowed to start. If a utility starts a subtask after -STOP DB2 MODE (QUIESCE) has been issued, message DSNU006I is issued and the subtask and utility might end abnormally.

(FORCE)

Terminates currently executing programs, including utilities. No new program is allowed to start. MODE(FORCE) probably causes indoubt situations. Some tasks, such as stored procedures tasks and Db2 service tasks, terminate abnormally. When they terminate abnormally, you might see dumps and messages from these failures.

CASTOUT

Specifies whether the Db2 member performs castout processing for the page sets or partitions for which the member was last updated. The CASTOUT option only applies in a data sharing environment.

YES

Allow group buffer pool castout processing.

NO

Skip group buffer pool castout processing.

Usage notes

MODE(QUIESCE): If MODE(QUIESCE) is used, all connected address spaces must terminate all connections before the Db2 subsystem stops. The system operator can tell whether any connections remain by using the DISPLAY THREAD command, and can cancel them by using the Db2 CANCEL command or z/OS commands.

MODE(FORCE): A forced stop does not cause an immediate abend. If a connected task is executing outside Db2, Db2 posts an exit routine to stop the task from accessing Db2. If a task is executing in Db2, it stops when the next "suspend" or "execution unit switch" occurs. In some cases, the delay before stopping can be significant.

CASTOUT(NO): Consider using CASTOUT(NO) when shutting down a Db2 data sharing member for maintenance, because the option can speed shutdown processing in a data sharing environment. If you are shutting down multiple members of a data sharing group with CASTOUT(NO), some changed data might reside in the group buffer pools after the members have shut down. Therefore, if you want consistent data on disk (for example, you are shutting down all members to create a copy of the database to send offsite), do not use CASTOUT(NO).

With CASTOUT(NO), the Db2 member shuts down with QC status, as displayed by the DISPLAY GROUP command, which indicates that the member quiesced with some castout processing not completed. A retained page set or partition P-lock is held in IX state for each object for which the Db2 member was the last updater. Also, group buffer pool connections enter a failed-persistent state.

Example

Example 1: Stop the Db2 subsystem. Allow currently active programs to complete. Do not allow new programs to identify to Db2.

```
-STOP DB2 MODE (QUIESCE)
```

Example 2: Stop a member of a data sharing group for maintenance.

```
-STOP DB2 MODE (QUIESCE) CASTOUT(NO)
```

Chapter 90. -STOP DDF (Db2)

The Db2 command STOP DDF stops the distributed data facility (DDF) if it has already been started; use this command to terminate the DDF interface to VTAM or TCP/IP.

Abbreviation: -STO DDF

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

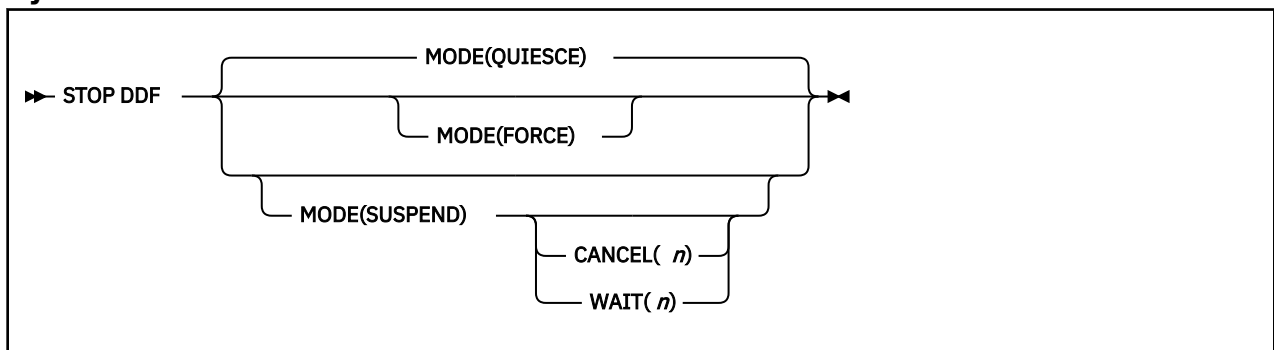

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

MODE

Indicates whether currently executing active distributed threads are allowed to complete.

(QUIESCE)

Allows active distributed threads that are using DDF to complete normally and terminates only inactive distributed threads. If DDF THREADS ACTIVE was specified during Db2 installation, all DDF threads are active threads.

(FORCE)

Terminates all currently executing distributed threads.

Some tasks, such as stored procedures tasks and Db2 service tasks, terminate abnormally. When they terminate abnormally, you might see dumps and messages resulting from these failures.

(SUSPEND)

Suspends all DDF threads by:

- Keeping inactive DDF threads inactive until a subsequent START DDF command is issued

- Terminating all DDF pool threads
- Preventing inbound DDF work from starting

MODE(SUSPEND) is intended to be used at a Db2 DRDA server when locking conflicts exist between CREATE, ALTER, DROP, GRANT, or REVOKE operations and client access to data. Requests that normally cause work to be dispatched (including requests for new connections) are queued. Outbound DDF processing is not affected by this command.

CANCEL (*n*)

Cancels all active DDF database access threads if suspend processing does not complete in *n* seconds. The range of *n* is 0 to 9999.

WAIT (*n*)

Resumes DDF processing if suspend processing does not complete in *n* seconds. The range of *n* is 0 to 9999.

Usage notes

MODE(QUIESCE): If MODE(QUIESCE) is used, all distributed activity must complete before DDF stops. The operator can tell whether any distributed threads remain by using DISPLAY THREAD with the LOCATION option. To cancel distributed threads that are preventing DDF from stopping, use [CANCEL THREAD](#) or STOP DDF MODE(FORCE).

MODE(QUIESCE) forces any inactive threads to terminate. A requesting system that is using two-phase commit on an inactive thread might report the terminated thread as indoubt at the system that issued STOP DDF. The thread is not actually indoubt (no commit or rollback is pending), and the condition is resolved when DDF is restarted.

MODE(FORCE): If MODE(FORCE) is used, the Db2 connection to VTAM or TCP/IP terminates. The termination forces all VTAM or TCP/IP requests to complete immediately, indicating that a communications error has occurred and DDF has stopped. A forced stop might take as long as three minutes to complete.

If any applications are updating remote servers that use two-phase commit, MODE(FORCE) might result in indoubt threads at each server.

MODE(SUSPEND): If MODE(SUSPEND) completes successfully, additional database resources, which are not inbound DDF work, might still be held. Cancel these additional resources with [CANCEL THREAD](#).

The following table summarizes the actions that Db2 takes when START DDF, STOP DDF, START DB2, and STOP DB2 commands are issued with different DDF states.

Table 32. The result of commands on the DDF status

DDF status	START DDF command	STOP DB2 or STOP DDF command without MODE(FORCE)	STOP DB2 or STOP DDF command with MODE(FORCE)	STOP DDF command with MODE(SUSPEND)
Starting	DSNL003I	DSNL003I	DSNL003I	DSNL003I
Started	DSNL001I	DDF stops	DDF forced stop	DDF suspends
Stopping	DSNL005I	DSNL005I	DSNL005I	DSNL005I
Stopped	DDF starts	DSNL002I	DSNL002I	DSNL002I
Suspending	DDF resumes	DDF stops	DDF forced stop	DSNL069I
Suspended	DDF resumes	DDF stops	DDF forced stop	DSNL065I

Examples

Example 1: Stop the distributed data facility (MODE QUIESCE).

```
-STOP DDF
```

Example 2: Stop the distributed data facility (MODE FORCE).

```
-STOP DDF MODE(FORCE)
```

Example 3: Suspend distributed data facility activity (MODE SUSPEND). If command processing continues after 600 seconds, cancel any remaining DDF threads.

```
-STOP DDF MODE(SUSPEND) CANCEL(600)
```

Chapter 91. -STOP DYNQUERYCAPTURE (Db2)

The Db2 command STOP DYNQUERYCAPTURE stops the capture of dynamic SQL statements by the specified monitors.

Abbreviation: -STO DYNQUERY

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

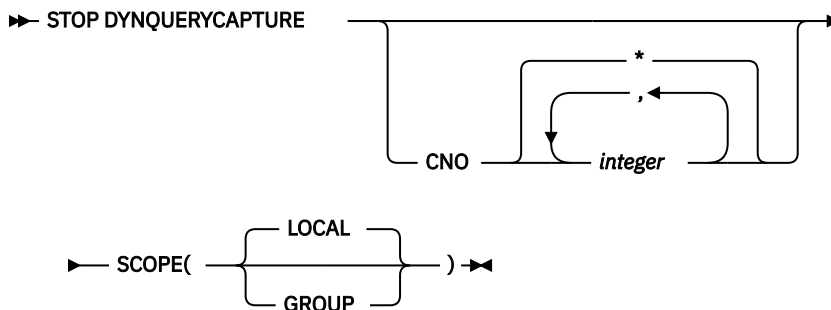

- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Environment

This command can be issued from the z/OS console, through a batch job, or the instrumentation facility interface (IFI).

Data sharing scope: Member

Syntax

Option descriptions

CNO(*integer*)

Stop a particular capture number, a list of capture numbers, or display all capture numbers.

Stop all active capture monitors.

integer

Stop the specified active capture monitors.

SCOPE

Specifies the scope of the command.

LOCAL

Stops the capture on the local Db2 system only.

GROUP

Stops the capture on all members of the data sharing group.

Output

Message DSNX224I is issued at successful completion of the STOP DYNQUERYCAPTURE command processing. For example, assume that you issue the following command:

```
-DB2ASTOP DYNQUERY CNO(1)
```

The following message is issued:

```
DSNX224I -DB2A DSNXESPC STOP DYNAMIC QUERY CAPTURE FOR COMMAND  
NUMBER (1) COMPLETED SUCCESSFULLY, WITH 1 QUERY CAPTURES STOPPED.
```

Similarly, assume that you issue the following command:

```
-DB2ASTOP DYNQUERY CNO(1)
```

The following message might be issued:

```
DSNX224I -DB2A DSNXESPC STOP DYNAMIC QUERY CAPTURE FOR COMMAND  
NUMBER (*) COMPLETED SUCCESSFULLY, WITH 2 QUERY CAPTURES STOPPED.
```

Message DSNX225I is issued if an active monitor process with specified *command-number* is not found. For example, assume that you issue the following command:

```
-DB2ASTOP DYNQUERY CNO(43)
```

If no matching active monitor process is found, the following message is issued:

```
DSNX225I -DB2A DSNXESPC STOP DYNAMIC QUERY CAPTURE FOR COMMAND  
NUMBER (43) FAILED. QUERY CAPTURE NUMBER (43) COULD NOT BE FOUND.
```

Related concepts

[Stabilizing access paths for dynamic SQL statements \(Db2 Performance\)](#)

Related reference

[-START DYNQUERYCAPTURE \(Db2\)](#)

The Db2 command START DYNQUERYCAPTURE stabilizes access paths for qualified cached dynamic queries. This command can also optionally start monitoring of cached dynamic queries that qualify for a scope but have not met the specified execution threshold for stabilization.

[-DISPLAY DYNQUERYCAPTURE \(Db2\)](#)

The Db2 command DISPLAY DYNQUERYCAPTURE displays all currently active dynamic query capture monitors.

[FREE STABILIZED DYNAMIC QUERY \(DSN\)](#)

The DSN subcommand FREE STABILIZED DYNAMIC QUERY removes from certain catalog tables one or more stabilized dynamic queries. If any of the specified queries are in the dynamic statement cache, FREE STABILIZED DYNAMIC QUERY purges the statements from the dynamic statement cache.

Related information

[DSNX225I \(Db2 Messages\)](#)

Chapter 92. -STOP FUNCTION SPECIFIC (Db2)

The Db2 command STOP FUNCTION SPECIFIC prevents Db2 from accepting SQL statements with invocations of the specified functions.

This command does not prevent SQL statements with invocations of the functions from running if they have already been queued or scheduled by Db2. You cannot use this command to stop built-in functions or user-defined functions that are sourced on another function.

Db2 implicitly issues the command STOP FUNCTION SPECIFIC ACTION(REJECT) for any function that exceeds the maximumabend count. That count is set by the MAX ABEND COUNT field of installation panel DSNTIPX.

Abbreviation: -STO FUNC SPEC

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the value of the SCOPE option.

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities for each function:

- Ownership of the function
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

If you specify STOP FUNCTION SPECIFIC **** or *schema.partial-name **, the privilege set of the process must include one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

(*.*)

Stops access to all functions, including functions that Db2 applications have not yet accessed.

If no functions are named, all functions are stopped.

schema.specific-function-name

Stops one specific function name. You cannot specify a function name as you can in SQL; you must use the specific name. If a specific name was not specified on the CREATE FUNCTION statement, query SYSIBM.SYSROUTINES for the correct specific name:

```
SELECT SPECIFICNAME, PARM_COUNT
FROM SYSIBM.SYSROUTINES
WHERE NAME='function_name'
AND SCHEMA='schema_name';
```

For overloaded functions, this query can return multiple rows.

*schema.partial-name **

Stops a set of functions in the specified schema. The specific names of all functions in the set begin with *partial-name* and can end with any string, including the empty string. For example, schema1.ABC* stops all functions with specific names that begin with ABC in schema1.

ACTION

Indicates what to do with an SQL statement that invokes the function while the function is stopped. If you issue STOP FUNCTION SPECIFIC more than once for a given function, the action that is taken is determined by the ACTION option on the most recent command.

(QUEUE)

Queues the request until either of the following conditions is true:

- The wait exceeds the installation timeout value.
- You issue START FUNCTION SPECIFIC command for the function.

(REJECT)

Rejects the request.

SCOPE

Specifies the scope of the command.

(LOCAL)

Specify to stop the function on the local member only.

(GROUP)

Specify to stop the function on all members of the data sharing group.

Usage notes

Limitations of STOP FUNCTION SPECIFIC : STOP FUNCTION SPECIFIC is only applicable to external functions that run in the WLM application environment or non-inline SQL functions. STOP FUNCTION SPECIFIC cannot stop a built-in function, an inline SQL function, or a user-defined function that is sourced on another function.

Permanently disabling a function : A stopped function does not remain stopped if Db2 is stopped and restarted. To disable a function permanently, you can:

- Use ALTER FUNCTION to change the LOADMOD name to a nonexistent z/OS load module
- Rename or delete the z/OS load module

Considerations for SQL functions: The STOP FUNCTION SPECIFIC command affects all versions of the SQL functions that you specify in the command.

Examples

Example 1: Stop access to all functions. While the STOP FUNCTION SPECIFIC command is in effect, Db2 queues all attempts to execute functions.

```
-STOP FUNCTION SPECIFIC ACTION(Queue)
```

This command produces output similar to the following output:

```
DSNX974I - DSNX9SP2 STOP FUNCTION SPECIFIC SUCCESSFUL FOR *.*
DSN9022I - DSNX9COM '-STOP FUNC' NORMAL COMPLETION
```

Example 2: Stop access to all functions. While the STOP FUNCTION SPECIFIC command is in effect, Db2 rejects attempts to execute functions.

```
-STOP FUNCTION SPECIFIC ACTION(REJECT)
```

This command produces output similar to the following output:

```
DSNX974I - DSNX9SP2 STOP FUNCTION SPECIFIC SUCCESSFUL FOR *.*
DSN9022I - DSNX9COM '-STOP FUNC' NORMAL COMPLETION
```

Example 3: Stop functions PAYROLL.USERFN1 and PAYROLL.USERFN3. While the STOP FUNCTION SPECIFIC command is in effect, Db2 queues all attempts to execute functions.

```
-STOP FUNCTION SPECIFIC (PAYROLL.USERFN1,PAYROLL.USERFN3)
```

This command produces output similar to the following output:

```
DSNX974I - DSNX9SP2 STOP FUNCTION SPECIFIC SUCCESSFUL
FOR PAYROLL.USERFN1

DSNX974I - DSNX9SP2 STOP FUNCTION SPECIFIC SUCCESSFUL
FOR PAYROLL.USERFN3

DSN9022I - DSNX9COM '-STOP FUNC' NORMAL COMPLETION
```

Example 4: Stop functions PAYROLL.USERFN1 and PAYROLL.USERFN3. While the STOP FUNCTION SPECIFIC command is in effect, Db2 rejects attempts to execute either of these functions.

```
-STOP FUNCTION SPECIFIC (PAYROLL.USERFN1,PAYROLL.USERFN3) ACTION(REJECT)
```

This command produces output similar to the following output:

```
DSNX974I - DSNX9SP2 STOP FUNCTION SPECIFIC SUCCESSFUL
FOR PAYROLL.USERFN1

DSNX974I - DSNX9SP2 STOP FUNCTION SPECIFIC SUCCESSFUL
FOR PAYROLL.USERFN3
```

DSN9022I - DSNX9COM '-STOP FUNC' NORMAL COMPLETION

Chapter 93. STOP irlmproc (z/OS IRLM)

The STOP *irlmproc* command shuts IRLM down normally. The command is rejected if any active Db2 subsystems are currently identified to IRLM.

Abbreviation: P

Environment

This command can be issued only from a z/OS console.

Data sharing scope: Member

Authorization

The command requires an appropriate level of operating system authority.

Syntax

▶ STOP — *irlmproc* ▶◀

Option description

irlmproc

Identifies the procedure name for the IRLM to be stopped.

Usage note

Terminating the IRLM: If IRLM does not shut down normally, issue the MODIFY *irlmproc*,ABEND command to terminate the IRLM abnormally:

```
F irlmproc,ABEND,DUMP
```

If outstanding Db2 requests are in process and IRLM does not terminate, use the z/OS CANCEL command. If all other means of removing the subsystem fail, issue the z/OS FORCE CANCEL command.

Example

Enter the following command on the system console:

```
P KRLM1
```

IRLM outputs the following responses on system console:

```
DXR165I IR21 TERMINATED VIA IRLM MODIFY COMMAND
DXR121I IR21 END-OF-TASK CLEANUP SUCCESSFUL - HI-CSA      325K
```

In a data sharing environment: You cannot issue the STOP *irlmproc* command to IRLM in a data sharing group until no Db2 subsystems are identified to that IRLM and the IRLM issues the following messages:

```
DXR136I IR21 HAS DISCONNECTED FROM THE DATA SHARING GROUP
```

Any members that are still active in the group issue:

```
DXR137I JR21 GROUP STATUS CHANGED. IR21 233 HAS BEEN DISCONNECTED
FROM THE DATA SHARING GROUP
```

Chapter 94. -STOP ML (Db2)

The Db2 command STOP ML stops the IBM Db2 AI for z/OS if it is already been started

Abbreviation: -STO ML

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

```
➤ STOP ML ➤
```

Usage note

The STOP ML command disables IBM Db2 AI for z/OS. In a data sharing environment, this command disables IBM Db2 AI for z/OS on all members in the data sharing group.

Example

Stop IBM Db2 AI for z/OS.

```
-STOP ML
```

Related reference

[-START ML \(Db2\)](#)

The Db2 command START ML starts IBM Db2 AI for z/OS.

[-DISPLAY ML \(Db2\)](#)

The Db2 command DISPLAY ML displays the current status of IBM Db2 AI for z/OS.

Chapter 95. -STOP PROCEDURE (Db2)

The Db2 command STOP PROCEDURE prevents Db2 from accepting SQL CALL statements for one or more stored procedures.

You can qualify stored procedure names with a schema name. This command does not prevent CALL statements from running if they have already been queued or scheduled by Db2.

Db2 implicitly issues the command STOP PROCEDURE ACTION(REJECT) for any stored procedure that exceeds the maximum abend count. That count is set by the MAX ABEND COUNT field of installation panel DSNTIPX.

Abbreviation: -STO PROC

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the value of the SCOPE option.

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

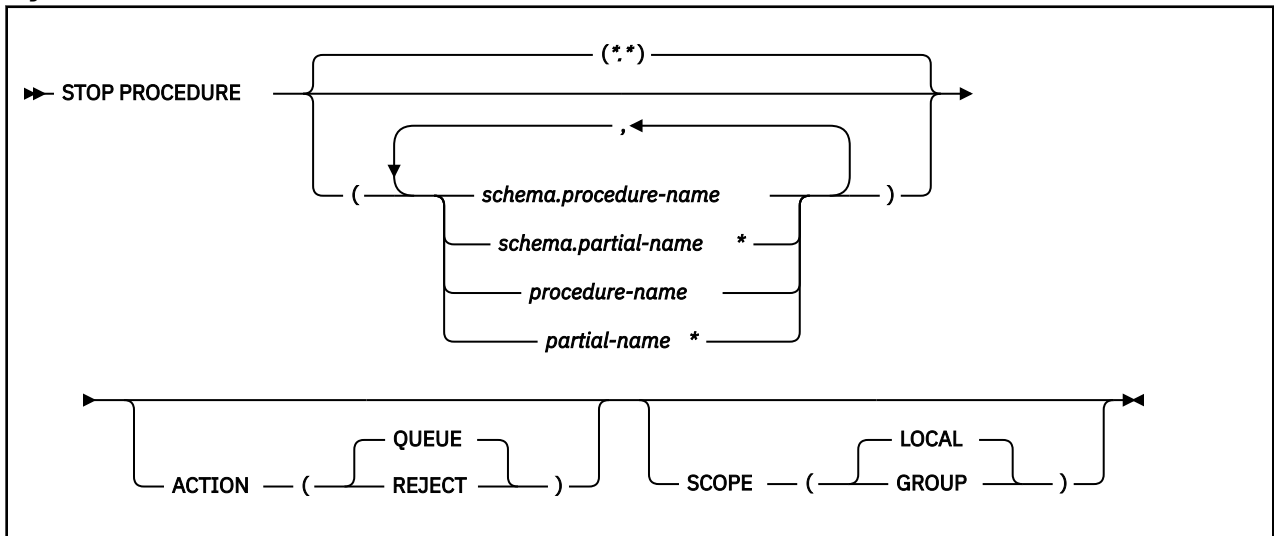

- Ownership of the stored procedure
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

If you specify STOP PROCEDURE *.* or *schema.partial-name **, the privilege set of the process must include one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

(,**)**

Stops access to all stored procedures in all schemas, including procedure definitions that have not yet been accessed by Db2 applications.

(*schema.procedure-name*)

Identifies the fully-qualified procedure name that is to be stopped.

(*schema.partial-name* *)

Stops a set of stored procedures in the specified schema. The names of all procedures in the set begin with *partial-name* and can end with any string, including the empty string. For example, PAYROLL.* stops all stored procedures in the PAYROLL schema.

procedure-name

Identifies one or more specific stored procedure names to be stopped. The procedure name is implicitly qualified with the SYSPROC schema name.

***partial-name* ***

Stops a set of stored procedures within the SYSPROC schema. The names of all procedures in the set begin with *partial-name* and can end with any string, including the empty string. For example, ABC* stops all stored procedures with names that begin with ABC.

ACTION

Indicates what to do with a CALL statement that is received while the procedure is stopped. If STOP PROCEDURE is issued more than once for a given procedure, the action taken is determined by the ACTION option on the most recent command.

(*QUEUE*)

Queues the request until either:

- The wait exceeds the installation timeout value, or
- The stored procedure is started by the command START PROCEDURE.

(*REJECT*)

Rejects the request

SCOPE

Specifies the scope of the command.

(*LOCAL*)

Specify to stop the procedure on the local member only.

(*GROUP*)

Specify to stop the procedure on all members of the data sharing group.

Usage notes

Permanently disabling a stored procedure: A stopped procedure does not remain stopped if Db2 is stopped and restarted. To disable a stored procedure permanently, you can:

- Drop the procedure using the DROP PROCEDURE statement.
- Use an ALTER PROCEDURE statement.
- Rename or delete the z/OS load module.

Considerations for native SQL procedures: The STOP PROCEDURE command affects all versions of the native SQL procedures that you specify in the command.

Examples

Example 1: Stop access to all stored procedures, and terminate the Db2 stored procedures address space. While the STOP PROCEDURE command is in effect, attempts to execute stored procedures are queued.

```
-STOP PROCEDURE ACTION(Queue)
```

```
DSNX947I - DSNX9SP2 STOP PROCEDURE SUCCESSFUL FOR *.*
DSN9022I - DSNX9COM '-STOP PROC' NORMAL COMPLETION
```

Example 2: Stop access to all stored procedures, and terminate the Db2 stored procedures address space. While the STOP PROCEDURE command is in effect, attempts to execute stored procedures are rejected.

```
-STOP PROCEDURE ACTION(REJECT)
```

```
DSNX947I - DSNX9SP2 STOP PROCEDURE SUCCESSFUL FOR *.*
DSN9022I - DSNX9COM '-STOP PROC' NORMAL COMPLETION
```

Example 3: Stop stored procedures USERPRC1 and USERPRC3. While the STOP PROCEDURE command is in effect, attempts to execute these stored procedure are queued.

```
-STOP PROCEDURE (USERPRC1,USERPRC3)
```

```
DSNX947I - DSNX9SP2 STOP PROCEDURE SUCCESSFUL FOR USERPRC1
DSNX947I - DSNX9SP2 STOP PROCEDURE SUCCESSFUL FOR USERPRC3
DSN9022I - DSNX9COM '-STOP PROC' NORMAL COMPLETION
```

Example 4: Stop stored procedures USERPRC1 and USERPRC3. While the STOP PROCEDURE command is in effect, attempts to execute these stored procedure are rejected.

```
-STOP PROCEDURE (USERPRC1,USERPRC3) ACTION(REJECT)
```

```
DSNX947I - DSNX9SP2 STOP PROCEDURE SUCCESSFUL FOR USERPRC1
DSNX947I - DSNX9SP2 STOP PROCEDURE SUCCESSFUL FOR USERPRC3
DSN9022I - DSNX9COM '-STOP PROC' NORMAL COMPLETION
```

Chapter 96. -STOP PROFILE (Db2)

The Db2 command STOP PROFILE is used to stop or disable the profile function.

Environment

This command can be issued from the z/OS console, through a batch job or the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Syntax

►► STOP PROFILE ◄◄

Examples

Example 1: This command is used to stop or disable the profile function.

```
-STOP PROFILE
```

Related tasks

[Monitoring and controlling Db2 with profile tables \(Db2 Administration Guide\)](#)

Related reference

[Profile tables \(Db2 Performance\)](#)

[-START PROFILE \(Db2\)](#)

The Db2 command START PROFILE loads or reloads the profile table into a data structure in memory.

Chapter 97. -STOP RLIMIT (Db2)

The Db2 command STOP RLIMIT stops the resource limit facility.

All previously limited SQL statements run without limits. However, the processing time continues to accumulate for statements that continue to run after the STOP RLIMIT command is issued.

Abbreviation: -STO RLIM

Environment

This command can be issued from a z/OS console, a DSN session under TSO, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Member

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

➤ STOP RLIMIT ➤

Example

Stop the resource limit facility.

```
-STOP RLIMIT
```

Related tasks

[Starting and stopping resource limit tables \(Db2 Performance\)](#)

[Specifying and changing resource limits \(Db2 Performance\)](#)

Related reference

[-START RLIMIT \(Db2\)](#)

The Db2 command START RLIMIT starts the resource limit facility (governor) and specifies a resource limit specification table for the facility to use.

[-DISPLAY RLIMIT \(Db2\)](#)

The Db2 command DISPLAY RLIMIT displays the current status of the resource limit facility (governor).

Chapter 98. -STOP RESTSVC (Db2)

The Db2 command STOP RESTSVC prevents Db2 from accepting any new discover details or invoke requests for one or more REST services. You can qualify REST service names with a collection ID name.

On successful completion of the command, the specified REST services will be stopped and any new requests for the specified REST services will fail with an HTTP 503 (Resource unavailable) return status.

Abbreviation: -STO RESTSVC

Environment

This command can be issued from a z/OS® console, a DSN session under TSO, a DB2I panel (Db2 COMMANDS), an IMS™ or CICS® terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group

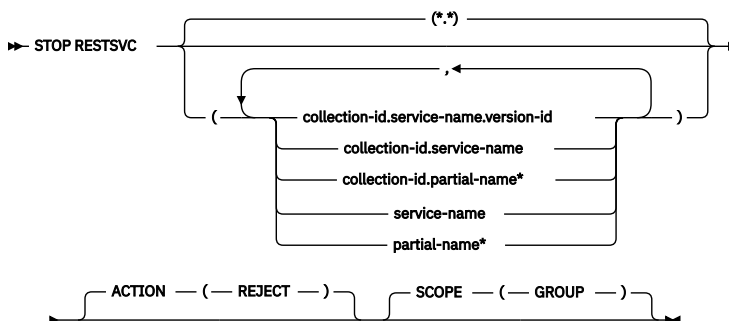

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following authorities:

- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

Option descriptions

For mixed case names, use single quotes (') around the input.

(*,*)

Marks all versions of all REST services in all collection-ids as stopped and unavailable to be called.
Note: when specified, *,* can be the only SERVICE parameter.

(collection-id.service-name.version-id)

Stops a specific version of the specified REST service in the specified collection-id.

(collection-id.service-name)

Stops all versions of the specified REST service in the specified collection-id.

(collection-id.partial-name*)

Stops all versions in a set of REST services in the specified collection-id. The names of all REST services in the set begin with partial-name and can end with any string, including the empty string. For example, PAYROLL.ABC* starts all REST services with names that begin with ABC in the PAYROLL collection-id.

(service-name)

Stops all versions of the specified REST service in the SYSIBMSERVICE collection-id.

(partial-name*)

Marks all versions in a set of REST services in the SYSIBMSERVICE collection-id as stopped and unavailable to be called. The names of all REST services in the set begin with partial-name and can end with any string, including the empty string. For example, ABC* starts all REST services names that begin with ABC in the SYSIBMSERVICE collection-id.

ACTION

Indicates what to do with a REST discover or invoke request that is received while the REST service is stopped.

(REJECT)

Rejects the request.

SCOPE

Specifies the scope of the command.

(GROUP)

Stops the specified REST services in all members of the data sharing group.

Usage notes

The STOP RESTSVC command affects all versions of the REST services that you specify in the command.

The STOP RESTSVC command only affects the REST services that already exist when the command is issued.

Output

Message [DSNL601I \(Db2 Messages\)](#) indicates the beginning of the output of a STOP RESTSVC command. Message [DSN9022I \(Db2 Messages\)](#) will indicate the end of the output of the command if no failure occurred during the processing of the command. Message [DSN9023I \(Db2 Messages\)](#) will indicate the end of the output of the command if an abend had occurred during the processing of the command.

Examples**Example: No authority for a STOP RESTSVC command**

The following command attempts to use the STOP RESTSVC command on a service that the user does not have the proper authorities for:

```
-DB2A STO RESTSVC('DB2zRESTServiceTestCollectionID.simpleSelect3')
```

The output is similar to this output:

```
DSNL601I  -DB2A STOP RESTSVC REPORT FOLLOWS-
DSNL604I  -DB2A USER HAS INSUFFICIENT AUTHORITY FOR STOP RESTSVC OF
DB2zRESTServiceTestCollectionID.simpleSelect3
DSN9022I  -DB2A DSNLJDSS 'STOP RESTSVC' NORMAL COMPLETION
```

Example: Stop all services with the *BankDemo* collection ID name

The following command successfully uses the STOP RESTSVC command on all services within the *BankDemo* collection:

```
-DB2A STOP RESTSVC('BankDemo.*')
```

The output is similar to this output:

```
DSNL601I  -DB2A STOP RESTSVC REPORT FOLLOWS-  
DSNL607I  -DB2A ALL SERVICES HAVE BEEN STOPREJ FOR BankDemo.*  
DSN9022I  -DB2A DSNLJDSS 'STOP RESTSVC' NORMAL COMPLETION
```

Related reference

BIND SERVICE (DSN)

The BIND SERVICE (DSN) subcommand builds an application package that represents a Db2 REST service. Db2 records the description of the service in the catalog tables and saves the prepared package in the directory.

BIND and REBIND options for packages, plans, and services

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

-DISPLAY RESTSVC (Db2)

The Db2 command DISPLAY RESTSVC displays the status of REST services that exist in Db2.

-START RESTSVC (Db2)

The Db2 command START RESTSVC starts the definition of a REST service that is stopped. You can qualify REST service names with a collection ID name.

FREE SERVICE (DSN)

The FREE SERVICE (DSN) subcommand deletes an application package that represents a Db2 REST service. The command also removes the corresponding entry from the catalog tables.

Chapter 99. -STOP TRACE (Db2)

The Db2 command STOP TRACE stops tracing.

One additional option to this command and additional values for a few other options exist. This additional information is intended for service and use under the direction of IBM Support.

Abbreviation: -STO TRA

Environment

This command can be issued from a z/OS console, a DSN session, a DB2I panel (DB2 COMMANDS), an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or local, depending on the value of the SCOPE option.

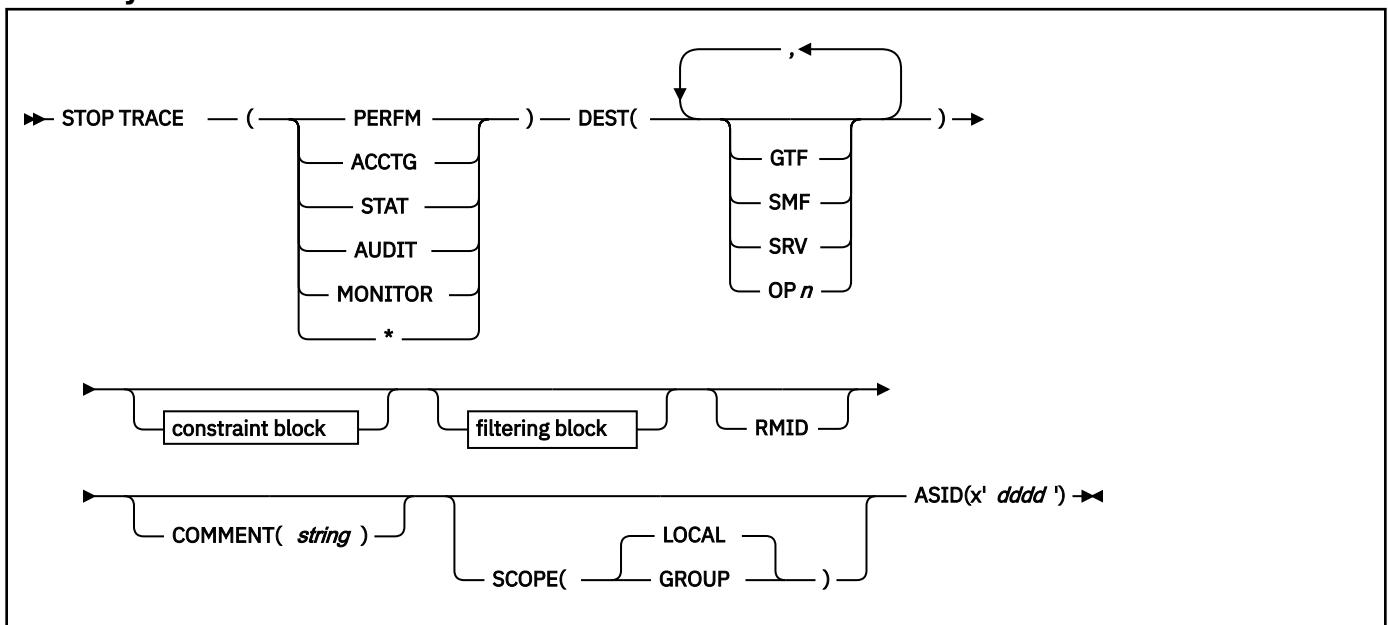

Authorization

To execute this command, you must use a privilege set of the process that includes one of the following privileges or authorities:

- TRACE privilege
- SQLADM authority
- System DBADM authority
- SYSOPR authority
- SYSCTRL authority
- SYSADM authority
- SECADM authority

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

Syntax

constraint block

Notes:

¹ You cannot specify CLASS or IFCID with AUDTPLCY. AUDTPLCY applies to trace type AUDIT.

filtering block

Option descriptions

For additional descriptions of each of the following trace types, see [Chapter 84, “-START TRACE \(Db2\),” on page 471](#).

(PERFM)

Specify to stop a trace that is intended for performance analysis and tuning.

Abbreviation: P

(ACCTG)

Specify to stop an accounting trace.

Abbreviation: A

(STAT)

Specify to stop a trace that collects statistical data. The LOCATION option cannot be specified when you choose a statistics trace.

Abbreviation: S

(AUDIT)

Specify to stop a trace that collects audit data from various components of Db2.

Abbreviation: AU

(MONITOR)

Specify to stop a trace that collects monitor data.

Abbreviation: MON

(*)

Specify to stop all trace activity. See [“Usage notes” on page 537](#) for information about using STOP TRACE (*) with traces that use monitor trace class 6.

SCOPE

Specifies the scope of the command.

(LOCAL)

Stops the trace only on the local Db2 subsystem.

(GROUP)

Stops the trace on all members of a data sharing group.

[FL 509](#) You cannot specify SCOPE(GROUP) to stop audit traces that use tamper-proof audit policies.

ASID(x'dddd')

Specifies that the trace for an address space is to be stopped.

dddd is a four-byte hexadecimal address space ID (ASID).

RMID

Specifies resource manager identifier. You can specify up to 8 valid RMIDs, which are one or two digit identifiers. You cannot specify RMID for accounting or statistic traces.

COMMENT (*string*)

Gives a comment that is reproduced in the trace output record for the STOP TRACE command (except in the resident trace tables).

string is any SQL string; it must be enclosed between apostrophes if it includes a blank, comma, or special character.

DEST

Limits stopping to traces started for particular destinations. You can use more than one value, but do not use the same value twice. If you do not specify a value for DEST, Db2 does not use destination to limit which traces to stop.

Abbreviation: D

Possible values and their meanings are:

Value

Trace destination

GTF

The generalized trace facility

SMF

The System Management Facility

SRV

An exit to a user-written routine

OP *n*

A specific destination. *n* can be a value from 1 to 8

See [Chapter 84, “-START TRACE \(Db2\),” on page 471](#) for a list of allowable destinations for each trace type.

CLASS(*integer* , ...)

Limits stopping to traces started for particular classes. For descriptions of the allowable classes, see [Chapter 84, “-START TRACE \(Db2\),” on page 471](#). You cannot specify a class if you did not specify a trace type.

Abbreviation: C

The **default** is CLASS (***) , which does not limit the command.

TNO(*integer* , ...)

Limits stopping to particular traces, identified by their trace numbers (1 to 32, 01 to 09). You can use up to eight trace numbers. If you use more than one number, you can use only one value each for PLAN, AUTHID, and LOCATION.

The **default** is TNO (***) , which does not limit the command.

PLAN(*plan-name* , ...) or XPLAN(*plan-name* , ...)

Introduces a list of specific plans for which trace information is gathered. Use PLAN to constrain the trace to the specified plans or XPLAN to exclude the specified plans. You cannot use this option for a STAT trace.

The **default** is PLAN (***) .

(*)**

Stops a trace for all plans.

plan-name

The name of an application plan. You can use up to eight names. If you use more than one name, you can use only one value for AUTHID and LOCATION.

PKGLOC or XPKGLOC

Specifies the location name where the package is bound. Use PKGLOC to constrain the trace to the specified locations or XPKGLOC to exclude the specified locations.

PKGCOL or XPKGCOL

Specifies the package collection name. Use PKGCOL to constrain the trace to the specified collections or XPKGCOL to exclude the specified collections.

PKGPROG or XPKGPROG

Specifies the DBRM or program name. Use PKGPROG to constrain the trace to the specified programs or XPKGPROG to exclude the specified programs.

AUTHID(*authorization-id* , ...) or XAUTHID(*authorization-id* , ...)

Introduces a list of specific authorization IDs for which trace information is gathered. Use AUTHID to constrain the trace to the specified authorization IDs or XAUTHID to exclude the specified authorization IDs. The authorization IDs specified must be the primary authorization IDs. You cannot use this option for a STAT trace.

The **default** is AUTHID (***) .

(*)

Stops a trace for all authorization IDs.

authorization-id

Specifies an authorization ID. You can use up to eight identifiers. If you use more than one identifier, you can use only one value for PLAN and LOCATION.

LOCATION(*location-name* , ...) or XLOC(*location-name* , ...)

Specifies a list of location names for which trace information is gathered. Use LOCATION to constrain the trace to the specified locations or XLOC to exclude the specified locations. The use of the LOCATION or XLOC option precludes tracing threads that have no distributed data relationship.

location-name

Identifies the Db2 subsystems whose distributed threads you want to trace. Activates the Db2 trace for the remote TCP/IP or SNA location that you specify by *location-name*.

You can specify up to eight locations. You can specify only one location if you use more than one plan name or authorization ID.

<luname>

Activates the Db2 trace for the remote clients that are connected to DDF through the remote SNA LU name that you specified in *luname*.

ipaddr

Activates the Db2 trace for the remote clients that are connected to DDF through the remote TCP/IP host. *ipaddr* is the IP address.

(*)

Indicates that you want to stop trace events that occur under distributed threads regardless of which location they are connected to. Specifying the local location name is equivalent to specifying LOCATION(*).

Clients other than Db2 for z/OS: Db2 for z/OS does not receive a location name from clients that are not Db2 for z/OS subsystems. To stop a trace for a client that is not a Db2 for z/OS subsystem, enter its LUNAME or IP address. Enclose the LUNAME by the less-than (<) and greater-than (>) symbols. Enter the IP address in the form *nnn.nnn.nnn.nnn*. For example, to stop a trace for a client with the LUNAME of LULA, enter the following command:

```
-STOP TRACE (*) LOCATION (<LULA>)
```

To stop a trace for a client with the IP address of 123.34.101.98, enter the following command:

```
-STOP TRACE (*) LOCATION (: :FFFF:123.34.101.98)
```

USERID or XUSERID

Specifies the user ID. Use USERID to constrain the trace to the specified user IDs or XUSERID to exclude the specified user IDs. You can specify multiple values and wildcard values as described in [Usage notes](#).

USERID and XUSERID can be up to 16 characters.

APPNAME or XAPPNAME

Specifies the application name. Use APPNAME to constrain the trace to the specified applications or XAPPNAME to exclude the specified applications. You can specify multiple values and wildcard values as described in [Usage notes](#).

APPNAME and XAPPNAME can be up to 32 characters.

WRKSTN or XWRKSTN

Specifies the workstation name. Use WRKSTN to constrain the trace to the specified workstations or XWRKSTN to exclude the specified workstations. You can specify multiple values and wildcard values as described in [Usage notes](#).

WRKSTN and XWRKSTN can be up to 18 characters.

CONNID or XCONNID

Specifies the connection ID. Use CONNID to constrain the trace to the specified connections or XCONNID to exclude the specified connections.

CORRID or XCORRID

Specifies the correlation ID. Use CORRID to constrain the trace to the specified correlation IDs or XCORRID to exclude the specified correlation IDs.

ROLE or XROLE

Specifies the connection roles. Use ROLE to constrain the trace to the specified roles or XROLE to exclude the specified roles.

AUDTPLCY

Stops the IFCIDs that correspond to the categories specified in the listed audit policies. You can specify up to eight audit policy names. AUDTPLCY applies to trace type AUDIT. You cannot specify CLASS or IFCID with AUDTPLCY.

Usage notes

Stopping specific traces: Each option that you use, except TNO, limits the effect of the command to active traces that were started using the same option, either explicitly or by default, with exactly the same parameter values. For example, the following command stops only the active traces that were started using the options PERFM and CLASS (1,2):

```
-STOP TRACE (PERFM) CLASS (1,2)
```

This command does *not* stop, for example, any trace started using CLASS(1).

You must specify a trace type or an asterisk. For example, the following command stops all active traces:

```
-STOP TRACE (*)
```

Traces that use monitor trace class 6: When stopping trace classes, a special circumstance occurs if monitor trace class 6 is active. Monitor trace class 6 enables and disables data propagation. To avoid accidentally stopping this trace class, the commands STOP TRACE(*) and STOP TRACE(MON) CLASS(*) fail if monitor trace class 6 is active.

To stop monitor trace class 6, you must explicitly specify it as one of the arguments of the CLASS option of the STOP TRACE command, including any other monitor trace classes that were started with monitor trace class 6. For example, if monitor trace class 6 was started with the command -START TRACE(MON) CLASS(1,3,6), the following command stops it:

```
-STOP TRACE(MON) CLASS(1,3,6)
```

In the case where monitor trace class 6 was started with the command -START TRACE(MON) CLASS(*), you must explicitly specify all 32 monitor trace classes to have monitor trace class 6 stopped:

```
-STOP TRACE(MON) CLASS(1,2,3,4,5,6,...32)
```

However, if monitor trace class 6 is not active the STOP TRACE(*) command stops all active traces.

FL 509 Audit traces that use tamper-proof audit policies: If you specify the STOP TRACE(*) command with the SCOPE(GROUP) option to stop an audit trace that uses a tamper-proof audit policy, the tamper-proof audit policy is not stopped for the data sharing group and message DSNW122I is issued. You cannot use SCOPE(GROUP) to stop tamper-proof audit policies.

Recommendation: FL 509 Stop all tamper-proof audit policies in one trace number group by using the STOP TRACE command. Doing so helps avoid the possibility of mismatching trace numbers among data sharing members if the SCOPE(GROUP) option is used to stop a tamper-proof audit policy.

To stop a tamper-proof audit policy on all members of a data sharing group, issue the STOP TRACE command on each member of the data sharing group.

Do not stop traces that were started by a IFI/IFC program: Before you stop an active trace, ensure that an IFI application program or the IFC Selective Dump utility (DSN1SDMP) did not start the trace. If you stop a trace started by DSN1SDMP, the DSN1SDMP utility abnormally terminates.

Stopping a trace for specific threads using the * wildcard: You can use the wildcard suffix, "*" to stop traces for certain threads. For example, if you specify -STOP TRACE PLAN (A,B,C*), Db2 will stop traces for threads "A", "B" and all threads starting with "C".

Stopping a trace for specific threads using the positional, () wildcard: You can use the positional wildcard, which is represented by the, "_" character, to stop traces for threads with a specific character in the middle, or when you want to stop the trace for threads of a specific length. For example, if you specify -STOP TRACE PLAN (A_C), all traces will be stopped for threads that are three characters that have "A" as the first character, and "C" as the third. If you want to stop tracing threads for plan "A_C", issue -STOP TRACE PLAN (A/_C). The "/" before the "_" tells Db2 to stop the trace for plans with an underscore in the name, rather than treating the underscore as a wildcard. The same logic applies if you are trying to stop a trace for a thread whose plan includes a "/" or "*" character. Because the character "/" is an escape character, if you are trying to stop the trace for a thread whose plan has a "/" character in it, you can specify, for example, -STOP TRACE PLAN (A//C) to stop the trace for threads for plan "A/C". You can also specify -STOP TRACE PLAN (A/*C) to stop the trace for threads for plan name "A*C".

Stopping a trace for multiple threads at once using wildcards: You also have the option of stopping the trace of multiple threads based on multiple trace qualifications. For example, you can specify -STOP TRACE PLAN (A*, B*, C*) to simultaneously stop the trace for ALL threads for plans that start with "A", "B", and "C". The wildcard character, "*" stops the trace for all threads. You can specify more complex combinations such as -STOP TRACE PLAN (A_B*, C*, AND C/_D*), which will stop the trace for all threads that:

- Begin with "A", have a one character wild card as the second character in the thread, have a "B" as the third character in the thread, and end with any type or number of characters (**ADBIOP**, **AOBTYJDP**),
- Begin with "C", and end with any combination of characters (**CDE**, **CGHKO**)
- Begin with "C_D" and end with any type of character combination (**C_DEFGH**, **C_DLMNOP**)

Traces for all of the possible thread combinations listed above will be stopped with the command above.

You have the ability to filter multiple threads at the same time, setting specific criteria for stopping the trace. For example, you can specify -STOP TRACE PLAN (A) USERID (B). This will stop the trace for threads where the plan is A, and the user ID is B. When stopping the trace for threads, you can only specify more than one thread criteria for one filter for each -STOP TRACE command. For example, you can specify -STOP TRACE PLAN (A,B) USERID (B) WRKSTN (E), but you cannot specify -STOP TRACE PLAN (A, B) USER ID (A, B) WRKSTN (E) because, in this example, two of the filter qualifications have two elements defined, and Db2 only allows for one attribute to have more than one trace element to be defined for a trace.

Filtering threads using exclude functionality: When you specify an "X" with any constraint keyword, such as "XPLAN", you are using the exclude functionality for the -STOP TRACE command. You have the option of excluding specific types of threads when you are stopping traces. You can use the "X" character to exclude specific combinations of characters when you are stopping a trace. For example, you can specify -STOP TRACE XPLAN(A), to stop the trace for all threads **except** "A". In this instance B, BCD, BCDE, or CD could possibly be returned.

You also have the option of excluding multiple types of threads from your trace. For example, you can specify -STOP TRACE XPLAN (A*, B*) to stop the trace for all threads **except** those starting with "A", with any combination of characters following "A", and all those characters starting with "B", with any combination of characters following "B". Note: Specifying XPLAN (*) excludes all threads from your search, and is not allowed. You also cannot use the wildcard in the middle of a STOP TRACE command with exclude functionality, such as -STOP TRACE XPLAN (A*C). You can, however, specify -STOP TRACE XPLAN (A_ _ C *), which will stop the trace for all threads **except** those starting with "A", a variety of **two** characters next, a "C" in the fourth space, and a variety of characters at the end. The wildcard symbol cannot be placed in the middle of trace criteria.

You have the ability to stop two traces at once. For example, you can specify -STOP TRACE XPLAN (A, B, C) USERID (D). This tells Db2 to stop tracing all threads for plans **except** "A", "B", or "C", only where the user ID is "D".

Combining trace qualifiers: You can customize the threads for which you stop a trace by specifying some threads, and excluding other threads. For example, you can specify -STOP TRACE USERID (A,B) XPLAN (C). This criterion only stops the trace for threads where the user ID is equal to "A" or "B", and the plan is **not** equal to "C". In this example, the trace for a thread where the user ID is "A" and the plan is equal to "D" would be stopped, but a trace for a thread where the user ID is "A" and plan is "C" would not be stopped.

You can introduce wildcards into your STOP TRACE commands to further customize the traces that are to be stopped. For example, you can specify -STOP TRACE PLAN (C*) USER ID (Z, X) XPLAN (C, D, E). In this example, for the trace to be stopped, the plan must begin with C, the user ID must be equal to Z or to X, and the plan cannot be C, D, or E. Therefore, a trace for a plan of CB, with a user ID of Z would be stopped, but a trace for a plan C with a user ID of X would not be stopped because the command specifies not to stop the trace for threads where the plan is "C", without additional characters in the thread.

Examples

Example 1: Stop all traces that have the generalized trace facility as their only destination.

```
-STOP TRACE (*) DEST (GTF)
```

Example 2: Stop an accounting trace of all threads between the local and USIBMSTODB21 Db2 subsystems for plan DSN8BC81. Include a comment.

```
-STOP TRACE (ACCTG)
PLAN (DSN8BC81)
LOCATION (USIBMSTODB21)
COMMENT('ACCTG TRACE FOR DSN8BC81')
```

Example 3: Stop trace number 4.

```
-STOP TRACE (P) TN0(4)
```

Example 4: Stop all active traces of any type for USIBMSTODB22.

```
-STOP TRACE (*) LOCATION (USIBMSTODB22)
```

Example 5: Stop all performance traces.

```
-STOP TRACE=P
```

Example 6: Stop all monitor tracing.

```
-STOP TRACE(MON)
```

Example 7: Stop all monitor tracing in a data sharing group.

```
-STOP TRACE(MON) SCOPE(GROUP)
```

Example 8: Stop all audit tracing that uses audit policy AUDITADMIN.

```
-STOP TRACE(AUDIT) DEST(GTF) AUDTPLCY(AUDITADMIN)
```

Related reference

-DISPLAY TRACE (Db2)

The Db2 command DISPLAY TRACE displays a list of active traces.

-MODIFY TRACE (Db2)

The Db2 command MODIFY TRACE changes the IFCIDs (trace events) associated with a particular active trace.

-START TRACE (Db2)

The Db2 command START TRACE starts Db2 traces.

Chapter 100. -TERM UTILITY (Db2)

The Db2 command TERM UTILITY terminates execution of a Db2 utility job step and releases all resources associated with the step.

When executing, a utility does not terminate until it checks to see that the TERM UTILITY command was issued. Active utilities perform this check periodically. If the utility is stopped, all its resources are released by the TERM UTILITY command. An active utility can be terminated only from the Db2 on which it is running. A stopped utility can be terminated from any active member of the data sharing group.

Abbreviation: -TER UTIL

Environment

This command can be issued from a z/OS console, a DSN session, DB2I panels DB2 COMMANDS and Db2 UTILITIES, an IMS or CICS terminal, or a program using the instrumentation facility interface (IFI).

Data sharing scope: Group or member. The utility is implicitly of group scope when the utility is stopped.

Authorization

To execute this command, you must use the primary or some secondary authorization ID of the process that originally submitted the utility job, or you must use a privilege set of the process that includes one of the following authorities:

- DBMAINT authority
- DBCTRL authority
- DBADM authority
- SYSOPR authority
- System DBADM authority
- DATAACCESS authority
- SYSCTRL authority
- SYSADM authority

For utilities that run on objects in implicitly created databases, the database privilege or authority can be held on the implicitly created database or on DSND04. Ownership of the table spaces or index spaces on which the utility operates is also sufficient to terminate the utility. This means that the owner can display information about an implicitly created table space or index space if the command explicitly specifies that table space or index space name.

The utilities DIAGNOSE, REPORT, and STOSPACE can be terminated only by the job submitter or by a holder of SYSOPR, SYSCTRL, or SYSADM authority.

Db2 commands that are issued from a logged-on z/OS console or TSO SDSF can be checked by Db2 authorization using primary and secondary authorization IDs.

For users with DBMAINT, DBCTRL, or DBADM authority, the command takes effect only when Db2 can determine that the user has sufficient authority over each object that the utility job accesses.

Database DSND06 contains the table spaces and index spaces that are required to check authorization. If a table or index space that is required for authorization checking is affected by a utility that you need to terminate, installation SYSADM authority is required to terminate that utility.

Syntax

Option descriptions

One of the following parameters must be specified.

(*utility-id*)

Is the utility identifier, or the UID parameter used when creating the utility job step.

If *utility-id* was created by the DSNU CLIST by default, it has the form *tso-userid.control-file-name*.

If *utility-id* was created by default by the EXEC statement invoking DSNUTILB, then the token has the form *userid.jobname*.

If *utility-id* contains lowercase letters or special characters, it must be enclosed in single quotation marks (').

(*partial-utility-id**)

Terminates every utility job that begins with *partial-utility-id* . For example, TERM UTILITY(ABCD*) terminates every utility job step whose utility identifier begins with the letters ABCD. If you have a two-part utility ID, such as ABCD.EFGH, TERM UTILITY(ABCD*) also terminates that utility.

(*)

Terminates every utility job step known to Db2 for which you are authorized.

Usage notes

Restarting utilities: A terminated utility job step cannot be restarted. You must resubmit the step as a new utility job.

What happens to particular utilities: In some cases, terminating a utility job can leave work in an undesirable state, requiring special processing before the job can be resubmitted. The following list describes the effects of TERM UTILITY on jobs for each of the utilities:

Utility

Special effects of the TERM UTILITY command

CATMAINT

Places indexes in REBUILD-pending status.

CHECK DATA

Table spaces remain in CHECK-pending status.

CHECK INDEX

None.

CHECK LOB

Places LOB table spaces and indexes in the utility read-only (UTRO) state.

COPY

Inserts "T" record in SYSIBM.SYSCOPY. When you run COPY, COPY does not allow an incremental image copy if the "T" record exists.

DIAGNOSE

None.

LOAD

Termination of LOAD

MERGECOPY

None.

MODIFY RECOVERY

If MODIFY RECOVERY, in the DELETEDS phase, detects that the TERM command has been issued, MODIFY RECOVERY stops deleting image copy data sets and proceeds to the UTILTERM phase. If the TERM command was issued on a MODIFY RECOVERY utility that abended in the DELETEDS phase, the TERM command terminates the MODIFY RECOVERY utility and the image copy data sets are not be deleted.

MODIFY STATISTICS

None.

QUIESCE

None.

REBUILD INDEX

Places the object that is being rebuilt in REBUILD-pending status.

RECOVER

Places the object that is being recovered in RECOVER-pending status.

REORG INDEX

[Termination of REORG INDEX](#)

REORG TABLESPACE

[Termination of REORG TABLESPACE](#)

REPAIR

None.

REPORT

None.

RUNSTATS

None.

STOSPACE

None.

UNLOAD

The output data set remains incomplete until you restart the utility job or delete the data set.

Examples

Example 1: Terminate all utility jobs for which you are authorized.

```
-TERM UTILITY (*)
```

Example 2: Terminate all utility jobs whose utility ID begins with SMITH.

```
-TERM UTILITY  
(SMITH*)
```

Related tasks

[Terminating an online utility \(Db2 Utilities\)](#)

Chapter 101. TRACE CT (z/OS IRLM)

The z/OS command TRACE CT starts, stops, or modifies a diagnostic trace for the internal resource lock manager (IRLM) of Db2.

IRLM does not support all the options available on the TRACE command.

Environment

This command can be issued only from a z/OS console.

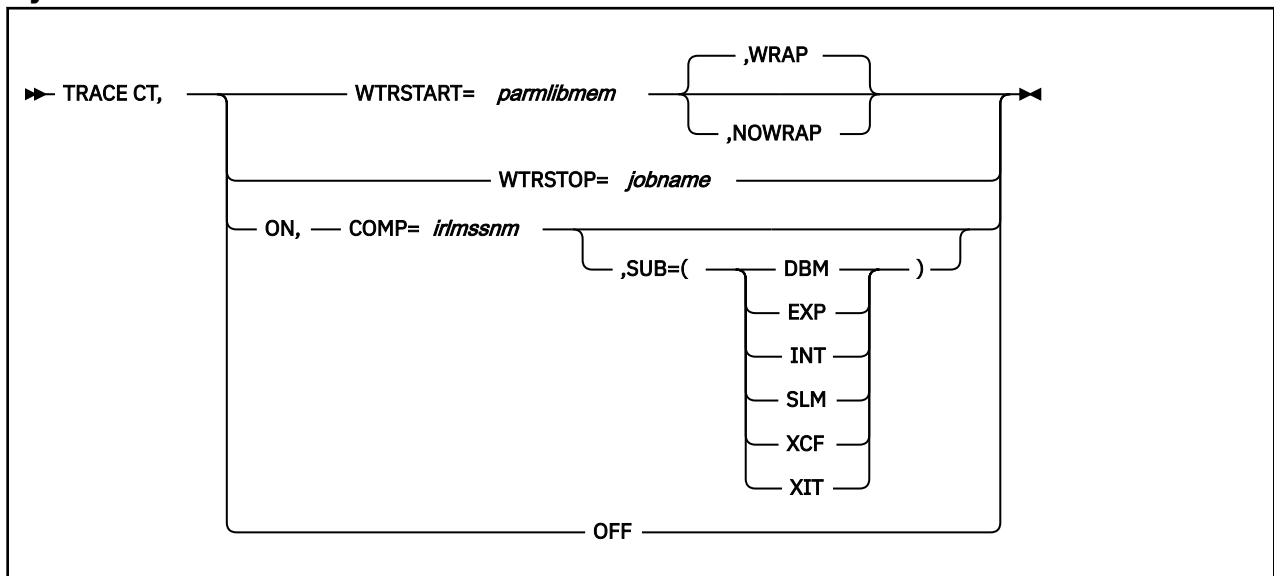

Data sharing scope: Member

Authorization

This command requires an appropriate level of operating system authority.

The syntax diagram and option descriptions for this command are purposely incomplete.

Syntax

Option descriptions

CT

Specifies the component trace. (Do not use other trace options available on the z/OS TRACE command).

WTRSTART= *parmllibmem*

Identifies the member that contains source JCL. That JCL executes the CTRACE writer and defines the data set to which it writes the trace buffers. This member can be a procedure cataloged in SYS1.PROCLIB or a job.

WRAP

Specifies that when the system reaches the end of the group of data sets, it writes over the oldest data at the beginning of the first data set in the group. The system uses only the primary extents of the data sets.

NOWRAP

Specifies that the system stops writing to the data sets when they are all full. The system uses the primary and secondary extents of the data sets.

WTRSTOP= *jobname*

Stops the CTRACE writer for a trace that is running. The system also closes the data sets that the writer used.

jobname identifies the trace, either by:

- Member name, if the source JCL is a procedure
- Job name, if that appears on a JOB statement in the source JCL

ON

Turns on the trace.

COMP= *irlmssnm*

Gives the IRLM subsystem name.

SUB= *subname*

Specifies the type of sublevel trace. Traces INT, EXP, and XIT are ON by default. You cannot turn off traces INT and EXP. If you do not specify a subname on the TRACE command, the trace is performed on all subnames that you control. Specifying one subname restricts the traces to that trace plus the EXP and INT traces.

Use:**To trace:****DBM**

Interactions with the identified DBMS

EXP

Any exception condition

INT

Member and group events outside normal locking activity

SLM

Interactions with the z/OS locking component

XCF

All interactions with z/OS cross-system coupling services

XIT

Only asynchronous interactions with the z/OS locking component

OFF

Turns off the trace. If IRLM is connected to a CTRACE writer for the component trace, the system disconnects it.

Usage notes

Include the IRLM load module in the z/OS link list: This command uses z/OS component trace services. Include the IRLM load module DXRRL183, which contains a routine for stopping and starting, in the z/OS link list.

Displaying a trace: To display a trace, use the z/OS DISPLAY command:

```
D TRACE,COMP=IRLM
```

The z/OS DISPLAY TRACE command output is incorrect for IRLM unless you use TRACE CT commands to inform z/OS of the TRACE status. IRLM initializes its own traces and writes them in CTRACE format, but IRLM has no interface to z/OS to inform it of the status. If you want to know the true status of the traces without using TRACE CT commands to inform z/OS, use the MODIFY *irlmproc*,STATUS,TRACE command.

Monitoring a trace: To monitor a trace, use the z/OS MODIFY *irlmproc*,STATUS,TRACE command.

Setting the number of trace buffers: To set the number of trace buffers used by traces, use the z/OS MODIFY *irlmproc*,SET command.

Sample procedure for the CTRACE writer: This procedure identifies the data set to which the next sample procedure writes data. The external trace writer must be executed at the same or higher dispatch priority as IRLM. This allows the I/O to keep up with the filling of the trace buffers.

```
//CTWTR    PROC
//          EXEC  PGM=ITTTTCWR
//TRCOUT01 DD    DSN=SYS1.WTR1,DISP=OLD
//TRCOUT02 DD    DSN=SYS1.WTR2,DISP=OLD
```

Sample procedure to start and stop a DBM trace to the CTRACE writer: These commands start and stop an IRLM DBM trace. The trace data is written to an external writer data set that is identified in procedure CTWTR.

```
TRACE CT,WTRSTART=CTWTR
TRACE CT,ON,COMP=IRLM,SUB=(DBM)
:
: (z/OS asks for a reply)
:
R 15,WTR=CTWTR,END
TRACE CT,OFF,COMP=IRLM,SUB=(DBM)
:
: (Wait to make sure trace buffers are externalized.)
TRACE CT,WTRSTOP=CTWTR
```

Sample procedure to start and stop traces in wrap-around mode: Traces captured in this procedure are saved in a limited number of buffers that are provided by IRLM. Each buffer is reused when the previous buffer is filled. To start the trace in this wrap-around mode, enter the following commands:

```
TRACE CT,ON,COMP=IRLM
:
: (z/OS asks for a reply)
:
R 15,END
:
TRACE CT,OFF,COMP=IRLM
```

Impact of setting TRACE CT ON: Each active subname type requires up to 0.7 MB of ECSA. Because IRLM initializes its own traces when it starts, the DISPLAY TRACE command shows that all traces are off. After you issue the TRACE ON command, the reports are accurate except for the two subname types, INT and EXT, which cannot be turned off.

Part 2. The Db2 command line processor

The Db2 command line processor is a program that runs under z/OS UNIX System Services. You can use the Db2 command line processor to execute SQL statements, bind DBRMs that are stored in HFS files into packages, call stored procedures, and perform XML schema repository operations.

The Db2 command line processor is an alternative to using SPUFI or DSNTEP2 to execute SQL statements. You can use it in interactive or batch mode:

- In *interactive mode*, you request a single operation, and the Db2 command line processor executes that operation and returns the result.
- In *batch mode*, you pass a file that contains all of the operations that you want to execute to the Db2 command line processor.

Related tasks

[Binding a DBRM that is in an HFS file to a package or collection \(Db2 Application programming and SQL\)](#)

Related reference

[Statements \(Db2 SQL\)](#)

Chapter 102. Start syntax for the Db2 command line processor

You start the Db2 command line processor by running the Java program `com.ibm.db2.clp.db2` from z/OS UNIX System Services.

java com.ibm.db2.clp.db2

Starts the Db2 command line processor.

To simplify starting the Db2 command line processor, you can define an alias for this command, and then start the command line process by specifying the alias. For example:

```
alias db2="java com.ibm.db2.clp.db2"
db2
```

-Ddb2.jcc.propertiesFile=java-properties-file

The Db2 command line processor runs under the IBM Data Server Driver for JDBC and SQLJ.

`-Ddb2.jcc.propertiesFile=java-properties-file` specifies the name of a file that contains configuration properties for the IBM Data Server Driver for JDBC and SQLJ. Specify this option only if your system administrator tells you to do so.

-Dfile.encoding=file-encoding

Specifies the file encoding that is used for a Db2 command line processor input file. For example, if the data in the input file has UTF-8 encoding, specify `-Dfile.encoding=UTF-8`.

option-flags

Specifies one or more options for the Db2 command line processor. When you specify more than one option, separate the option flags with spaces. To turn an option on, precede the option flag with a minus (-) sign. To turn the option off, precede the option flag with a plus (+) sign.

The following table lists the options and their default values, if the defaults have not been set in a Db2 command line processor properties file.

Table 33. Command line processor option flags		
Option flag	Option description	Default setting
a	Display the contents of the SQLCA after SQL statement execution.	OFF
c	Automatically commit SQL statements.	ON
f <i>file-name</i>	Read command input from the file specified by <i>file-name</i> .	OFF
o	Display data and messages on the standard output device.	ON

Table 33. Command line processor option flags (continued)

Option flag	Option description	Default setting
s	Stop the Db2 command line processor and exit to the operating system if an error occurs during execution of a statement or command.	OFF
t	Use the semicolon (;) as the statement termination character. If this option is not set, the command line processor handles each line as a complete statement unless the line ends with a space followed by a backslash (\).	OFF
tdx	Use x as the statement termination character.	OFF
u <i>user-id/credential</i>	Use the specified values when making a connection from the file specified in option flag f. user-id The user ID for the connection. credential The password or RACF PassTicket for the connection	OFF
v	Echo the command text to the standard output device.	OFF
x	Return data without any headers.	OFF
z <i>file-name</i>	Store output data and messages in the file specified by <i>file-name</i> .	OFF

The values of any options that you do not specify are determined by the values in the properties file that is specified by the CLPPROPERTIESFILE environment variable.

Examples

Example: Starting the Db2 command line processor with defaults

Suppose that no alias has been set for the Db2 command line processor name. Use this command to start the command line processor with the default values:

```
java com.ibm.db2.clp.db2
```

Example: Starting the Db2 command line processor with options

Suppose that the alias db2 has been set for the Db2 command line processorname. You want to start the command line processor with these options, which are not the default options:

- After each SQL statement is executed, the contents of the SQLCA are displayed.
- COMMIT is not executed automatically after each SQL statement.
- The statement termination character is that pound sign (#).

Use this command:

```
db2 -a +c -td#
```

Example: Starting the Db2 command line processor in batch mode

Suppose that the alias db2 has been set for the Db2 command line processor name. You want to run the command line processor with these options:

- The Db2 command line processor runs in batch mode. The db2commands.clp file contains the commands.
- The commands are echoed to the display.

Use this command:

```
db2 -f db2commands.clp -v
```

Example: Specifying a user ID and password or RACF PassTicket to run an SQL file

Suppose that you want to use the Db2 command line processor to connect to a server and your system administrator provides the following connection URL for the server: syszos1.abc.com:5021/ABCL0C1

You can create a file named script.sql that contains the following statement:

```
CONNECT TO syszos1.abc.com:5021/ABCL0C1
```

Also suppose that the alias db2 has been set for the Db2 command line processor name, and your user ID is myid01. If your password is mypw01, you can use the following command to connect to the server:

```
db2 -f script.sql -u myid01/mypw01
```

If your credential is the RACF PassTicket phrase TMOK73SJ, you can use the following command to connect to the server:

```
db2 -f script.sql -u myid01/TMOK73SJ
```

Chapter 103. Properties file for the Db2 command line processor

You can use a properties file to set your own defaults for Db2 command line processor properties.

The name of the Db2 command line processor properties file is determined by the setting of the CLPPROPERTIESFILE environment variable. A sample command line processor properties file named `clp.properties` is in directory `/usr/lpp/db2/db2c10/base/samples`.

The command line properties file is a text file that contains properties in *keyword=value* format. When you invoke the command line processor, the command line processor loads the properties file. Any changes to the properties file while the command line processor session is active do not take effect during the session. However, you can temporarily change option values that have a value of OFF or ON during the session with the UPDATE COMMAND OPTIONS command.

The following table lists the keywords and values that you can put in the command line processor properties file.

The following table lists the options and their default values, if the defaults have not been set by a command line processor properties file. If you specify a blank value for a property, the command line processor uses the default value.

Table 34. Command line processor option flags		
Keyword name	Option description	Possible values (first value is the default)
DisplaySQLCA	Display the contents of the SQLCA after SQL statement execution.	OFF ON blank
AutoCommit	Automatically commit SQL statements.	ON OFF blank
InputFilename	Read command input from the file specified by <i>file-name</i> .	<i>file-name</i> blank
DisplayOutput	Display data and messages on the standard output device.	ON OFF blank
StopOnError	Stop the command line processor and exit to the operating system if an error occurs during execution of a statement or command.	OFF ON blank

Table 34. Command line processor option flags (continued)

Keyword name	Option description	Possible values (first value is the default)
TerminationChar	<p>The statement or command termination character:</p> <p>OFF or blank The command line processor handles each line as a complete statement unless the line ends with a space followed by a backslash(\).</p> <p>ON Use the semicolon (;) as the statement termination character.</p> <p>single-character Use that character as the termination character</p>	<p>OFF</p> <p>ON</p> <p>single-character</p> <p>blank</p>
Echo	Echo the command text to the standard output device.	<p>OFF</p> <p>ON</p> <p>blank</p>
StripHeaders	Return data without any headers.	<p>OFF</p> <p>ON</p> <p>blank</p>
OutputFilename	Store output data and messages in the file specified by <i>file-name</i> .	<p>OFF</p> <p><i>file-name</i></p> <p>blank</p>
IsolationLevel	The SQL statement isolation level	<p>CS RR RS UR</p> <p>CS</p> <p>RR</p> <p>RS</p> <p>UR</p> <p>blank</p>
MaxLinesFromSelect	The maximum number of rows that are returned from an SQL SELECT statement	<p>ALL</p> <p>integer</p> <p>blank</p>
MaxColumnWidth	<p>The maximum number of characters in any column that is displayed after execution of:</p> <ul style="list-style-type: none"> • An SQL SELECT statement • An SQL CALL statement that returns a result set • A command line processor CATALOG command 	<p>500</p> <p>integer</p> <p>blank</p>

Table 34. Command line processor option flags (continued)

Keyword name	Option description	Possible values (first value is the default)
<i>connection-alias</i>	A string that represents the information that is required in a CONNECT command. The string consists of a connection URL, user ID, and password, separated by commas. The connection URL, user ID and password are defined in Chapter 115, “CONNECT (Db2 command line processor),” on page 585 . Users can specify <i>connection-alias</i> in a CONNECT command to simplify the connection process.	None

Related reference

[Start syntax for the Db2 command line processor](#)

You start the Db2 command line processor by running the Java program com.ibm.db2.clp.db2 from z/OS UNIX System Services.

Chapter 104. Help for the Db2 command line processor

The command line processor help command provides information about command line processor commands.

?

Indicates that this is a request for help. If the question mark (?) is specified by itself, a list of command line processor commands is displayed.

command

Indicates that this is a request for help for a specific command line processor command. You can specify one or more keywords in the command name. If more than one command begins with the same keyword, the command line processor displays help for all commands that begin with that keyword.

OPTIONS

Indicates that this is a request for a list of command line processor start-up options and their default settings.

Examples

Example: Displaying a list of command line processor commands

To see a list of all command line processor commands, run this command:

```
? 
```

Example: Displaying help for all LIST commands

To see help for all commands that begin with the keyword LIST, run this command:

```
? LIST 
```

Example: Displaying help for a specific LIST command

To see help for the LIST TABLES command, run this command:

```
? LIST TABLES 
```

Chapter 105. Running the Db2 command line processor

If you use z/OS UNIX System Services, you can run the Db2 command line processor.

Before you begin

Before you can use the Db2 command line processor, your z/OS UNIX System Services session needs to be set up to locate the Db2 command line processor code and the properties file that contains Db2 command line processor start-up options. See [Setting up the Db2 command line processor \(Db2 Installation and Migration\)](#) for details.

About this task

To run the Db2 command line processor:

Procedure

1. Start the Db2 command line processor.
See [Chapter 102, “Start syntax for the Db2 command line processor,”](#) on page 551.
2. Connect to a Db2 server using the [CONNECT](#) command.
You can disconnect from one server and connect to another server during the command line processor session by using the [DISCONNECT](#) command and another [CONNECT](#) command.
3. Run Db2 command line processor commands.

The Db2 command line processor lets you perform the following types of tasks:

Task	Command
Perform COMMIT, ROLLBACK, change isolation level, or DESCRIBE operations	COMMIT ROLLBACK CHANGE ISOLATION DESCRIBE CALL DESCRIBE TABLE
Execute other SQL statements, including CALL	Chapter 126, “SQL statements (Db2 command line processor),” on page 607
Perform XML schema repository operations	REGISTER XMLSCHEMA ADD XMLSCHEMA COMPLETE XMLSCHEMA REMOVE XMLSCHEMA
Bind packages	BIND
List the tables on the Db2 server	LIST TABLES
View or modify command line processor options	LIST COMMAND OPTIONS UPDATE COMMAND OPTIONS

Task	Command
View or modify the format of the command line processor output	DISPLAY RESULT SETTINGS CHANGE MAXCOLUMWIDTH CHANGE MAXLINESFROMSELECT
Add explanatory information to the output	ECHO
Run z/OS UNIX System Services commands	Chapter 128, “z/OS UNIX System Services (Db2 command line processor),” on page 611
Display command line processor help	Chapter 104, “Help for the Db2 command line processor,” on page 559

4. Stop the Db2 command line processor by running the [TERMINATE](#) command.

Related tasks

[Setting up the Db2 command line processor \(Db2 Installation and Migration\)](#)

Chapter 106. Tutorial: Using the Db2 command line processor

You can interactively query and modify Db2 data, call stored procedures, and issue z/OS UNIX System Services commands through the Db2 command line processor. This lesson demonstrates how to perform those tasks.

Before you begin

Before you start this tutorial, make sure that your system administrator has customized your environment appropriately:

- Your z/OS UNIX System Services .profile file needs to be set up so that you can use the Db2 command line processor.
- The command line processor properties file needs to include the alias MYALIAS01 for your connection information. A line of the following form must exist in the command line processor properties file.

```
MYALIAS01=connection-url,user-id,password
```

[Chapter 115, “CONNECT \(Db2 command line processor\),” on page 585](#) describes the syntax for *connection-url*, *user-id*, and *password*.

- An alias of db2 for the command that starts the Db2 command line processor must be created:

```
alias db2="java com.ibm.db2.clp.db2"
```

- The database server to which you connect must not be a data sharing system.

See [Setting up the Db2 command line processor \(Db2 Installation and Migration\)](#) for more information.

About this task

This tutorial demonstrates how to perform the same tasks in the Db2 command line processor that you can perform in SPUFI or DSNTEP2. In addition, this tutorial demonstrates how to call stored procedures from the Db2 command line processor.

In this tutorial, you will learn how to do the following Db2 command line processor tasks:

- Start and stop the Db2 command line processor
- List and modify Db2 command line processor options
- Connect to a database server
- Execute SQL statements to create, populate, query and drop a table
- Create a stored procedure
- Call a stored procedure

Conventions used in this tutorial: Although input to the Db2 command line processor is mostly case insensitive, SQL statements and command line processor commands are shown in uppercase for consistency with other Db2 operations.

Procedure

1. Start the command line processor, and set command line processor options.
 - a) Start the command line processor by typing the predefined alias:

```
db2
```

The command line processor starts, and the following prompt is displayed:

```
db2 =>
```

- b) Connect to a Db2 database server using the predefined connection alias:

```
CONNECT to MYALIAS01
```

The connection is established, and the following information about the connection is displayed:

```
Database Connection Information
Database server      =Db2 server version
SQL authorization ID =User ID
JDBC Driver         =JDBC driver name and version
DSNC101I : The "CONNECT" command completed successfully.
db2 =>
```

Information about the JDBC driver is displayed because the command line processor is a Java database application.

- c) Check the current settings of the command line processor options to determine whether they are right for your command line processor session:

```
LIST COMMAND OPTIONS
```

A list of command line processor options and their current settings is displayed:

Option	Description	Current Setting
-a	Display SQLCA	OFF
-c	Auto-Commit	ON
-f	Read from input file	OFF
-o	Display output	ON
-s	Stop execution on command error	OFF
-t	Set statement termination character	OFF
-u	Use user ID and password for input file	OFF
-v	Echo current command	OFF
-x	Suppress printing of column headings	OFF
-z	Save all output to output file	OFF

```
DSNC101I : The "LIST COMMAND OPTIONS" command completed successfully.
```

```
db2 =>
```

The options are described in [Table 33 on page 551](#).

- d) Suppose that you want to perform commit operations explicitly, so you want to disable autocommit. To do that, you need to set the c option to OFF:

```
UPDATE COMMAND OPTIONS USING c OFF
```

The following message is displayed, which indicates that you have successfully disabled the autocommit option:

```
DSNC101I : The "UPDATE COMMAND OPTIONS" command completed successfully.
```

```
db2 =>
```

2. Run SQL statements to query and modify data.

- a) Run an SQL CREATE statement to create a copy of sample employee table:

```
CREATE TABLE MY_EMP LIKE DSN8C10.EMP
```

- b) Run an SQL INSERT statement to populate your copy of the sample employee table from the sample employee table:

```
INSERT INTO MY_EMP SELECT * FROM DSN8C10.EMP
```

- c) Commit the previously run SQL operations:

```
COMMIT
```

- d) To make the output easier to read on the screen, set the maximum width of any column data that is returned to 12:

```
CHANGE MAXCOLUMNWIDTH TO 12
```

- e) Run this SELECT statement, to ensure that the table was created and the rows were inserted successfully:

```
SELECT FIRSTNME, MIDINIT, LASTNAME FROM MY_EMP ORDER BY LASTNAME
```

Rows from table MY_EMP are displayed:

```
FIRSTNME    MIDINIT  LASTNAME
BRUCE
ROY          R        ALONZO
DAVID
JOHN         B        GEYER
JASON        R        GOUNOT
...
MICHAEL      L        THOMPSON
JAMES        H        WALKER
HELENA
KIYOSHI
MASATOSHI    J        YOSHIMURA
42 record(s) selected

db2
=>
```

3. Terminate the command line processor, and restart it with a different set of options.

- a) Terminate the command line processor:

Terminate the command line processor:

```
TERMINATE
```

Control returns to z/OS UNIX System Services.

- b) Start the command line processor with the statement termination character set to the pound sign (#), so that you can terminate statements within an SQL PL procedure with semicolons (;):

```
db2 -td#
db2 =>
```

- c) Change the command line processor option for saving output to a file. Issue the following command to direct the command line processor to save the output to a file named clplog.txt, and to display the output on the screen:

```
UPDATE COMMAND OPTIONS USING z ON clplog.txt#
```

- d) Connect to a Db2 database server using the predefined connection alias:

```
CONNECT to MYALIAS01#
```

4. Create and call a stored procedure. Save the output to a file.

- a) Create stored procedure CALC_SAL.

Type the following lines on the display. Press Enter after you type each line. The command line processor considers all text up to the pound sign (#) to be a single statement.

```
CREATE PROCEDURE CALC_SAL(INOUT EMPNO_IN CHAR(6),
  IN PCT_RAISE DECIMAL(2,2),
  OUT EMPNAME VARCHAR(15),
  OUT SAL_CALC DECIMAL(9,2))
```

```

LANGUAGE SQL
BEGIN
DECLARE CURRENT_SALARY DECIMAL(9,2) DEFAULT 0;
SELECT LASTNAME, SALARY INTO EMPNAME, CURRENT_SALARY FROM MY_EMP
WHERE EMPNO=EMPNO_IN;
SET SAL_CALC=CURRENT_SALARY*PCT_RAISE+CURRENT_SALARY;
END#

```

- b) Call the CALC_SAL stored procedure to find out what the salary of employee '000100' will be if you give the employee a 5% raise:

```
CALL CALC_SAL('000100',.05,?,?)#
```

The following output is displayed:

```

Value of output parameters
-----
Parameter Name : EMPNO_IN
Parameter Value : 000100
Parameter Name : EMPNAME
Parameter Value : SPENSER
Parameter Name : SAL_CALC
Parameter Value : 27457.50

DSNC101I : The "CALL" command completed successfully.

db2 =>

```

- c) Run the z/OS UNIX System Services cat command from within the command line processor to view the contents of the clplog.txt file. The exclamation mark (!) at the beginning of a statement indicates that it is a z/OS UNIX System Services command.

```
!cat clplog.txt#
```

The contents of the clplog.txt file are displayed:

```

DSNC101I : The "UPDATE COMMAND OPTIONS" command completed successfully.

Value of output parameters
-----
Parameter Name : EMPNO_IN
Parameter Value : 000100
Parameter Name : EMPNAME
Parameter Value : SPENSER
Parameter Name : SAL_CALC
Parameter Value : 27457.50

DSNC101I : The "CALL" command completed successfully.

db2 =>

```

5. Clean up all objects that you created for this tutorial, and exit the command line processor.

- a) Change the command line processor option for saving output to a file back to its original setting of OFF:

```
UPDATE COMMAND OPTIONS USING z OFF#
```

- b) Drop the SQL objects that you created, and commit the changes.

```
DROP TABLE MY_EMP#
```

```
DROP PROCEDURE CALC_SAL#
```

```
COMMIT#
```

- c) Delete the file that contains command line processor output.

```
!rm clplog.txt#
```

- d) Terminate the command line processor session:

```
TERMINATE#
```

The command line processor session ends.

Chapter 107. Running the Db2 command line processor in batch mode

When you run the Db2 command line processor in batch mode, you can run all SQL statements in the batch as a single transaction.

Before you begin

- Your z/OS UNIX System Services .profile file and CLPPROPERTIES files need to be set up so that you can use the Db2 command line processor.

See [Setting up the Db2 command line processor \(Db2 Installation and Migration\)](#) for more information. Perform the optional steps as well as the required step in the procedure.

- To enable you to run the example in this topic, you need to make the following changes to the Db2 command line processor environment:
 - Include the alias MYALIAS01 for your connection information in the command line processor properties file. A line of the following form must exist in the command line processor properties file.

```
MYALIAS01=connection-url,user-id,password
```

[Chapter 115, “CONNECT \(Db2 command line processor\),” on page 585](#) describes the syntax for *connection-url*, *user-id*, and *password*.

About this task

To run the Db2 command line processor in batch mode, you provide the input from a file. When you run in batch mode, you can specify options to direct the command line processor to issue all of the SQL statements in the file in a single transaction. The transaction does not succeed unless all SQL statements succeed. If one or more SQL statements receive a negative SQLCODE, all SQL work is rolled back to the previous commit point.

To commit all SQL work in the input file, you include a COMMIT or TERMINATE statement at the end of the file. If there is no COMMIT or TERMINATE statement at the end of the file, all work is rolled back to the previous commit point.

Important: In the following situations that involve calls to stored procedures, a set of SQL statements are not executed as a single transaction because of COMMIT statements in the stored procedures or stored procedure definitions:

- A CALL statement in the input file calls a stored procedure that contains a COMMIT statement.
- A CALL statement in the input file calls a stored procedure that is defined as COMMIT ON RETURN YES.

In both cases, any SQL statements in the input file before the CALL statement are also committed.

Important: If you call a stored procedure that does work other than issuing SQL statements, such as issuing Db2 commands or utilities, the failure of SQL statements has no effect on the command or utility work. If the command or utility work completes successfully, that work is not rolled back if an SQL statement fails.

Procedure

To execute a set of SQL statements as a single transaction, follow these steps.

1. Create the Db2 command line processor input file in z/OS UNIX System Services.
2. Change to the directory that contains the input file that you created in the previous step.
3. Start the Db2 command line processor with a command like this one:

```
db2 +c -s -f file-name
```

- *file-name* is the input file that you created in step “1” on page 569.
- +c specifies that the SQL statements in the input file are not to be automatically committed.
- -s specifies that the Db2 command line processor stops processing input and exits if an error occurs during execution of an SQL statement or a Db2 command line processor command.

Example

Create a file named test.sql file with the following contents.

```
-- Input file for running Db2 Command Line Processor
-- in batch mode.
--
-- Issue a UNIX System Services cat command by
-- specifying ! before the command text
!cat test.sql
-- On the system that you set up to run the Db2 command line
-- processor, create a file with this content called test.sql.
-- Issue db2 +c -s -f test.sql to run it.
CONNECT TO MYALIAS01
LIST COMMAND OPTIONS
!echo CREATE DATABASE TESTDB
CREATE DATABASE TESTDB
CREATE TABLESPACE TESTSP IN TESTDB
CREATE TABLE TEST(COL1 INT NOT NULL, \
  COL2 VARCHAR(15), PRIMARY KEY(COL1)) IN TESTDB.TESTSP
CREATE UNIQUE INDEX INDEX1 ON TEST(COL1)
INSERT INTO TEST VALUES(1, 'ROW01')
INSERT INTO TEST VALUES(2, 'ROW02')
INSERT INTO TEST VALUES(3, 'ROW03')
INSERT INTO TEST VALUES(4, 'ROW04')
SELECT * FROM TEST
UPDATE TEST SET COL2='ROW000002' WHERE COL1=2
UPDATE TEST SET COL2='ROW000004' WHERE COL1=4
SELECT * FROM TEST
UPDATE TEST SET COL1=21 WHERE COL1=1
UPDATE TEST SET COL2='ROW0000021' WHERE COL1=1
SELECT * FROM TEST
-- The following statement will fail because the table name
-- does not exist (It is TSET instead of TEST.)
-- All SQL work in this file will be rolled back.
DELETE FROM TSET WHERE COL1=21
SELECT * FROM TEST
TERMINATE
```

Change to the directory that contains the test.sql file, and run the Db2 command line processor with test.sql as input:

```
db2 +c -s -f test.sql
```

Because the DELETE statement fails, all SQL work is rolled back.

Comment out the DELETE statement, and rerun Db2 command line processor with test.sql as input. All SQL statements are committed when the TERMINATE command runs.

Chapter 108. ADD XMLSCHEMA DOCUMENT (Db2 command line processor)

The ADD XMLSCHEMA DOCUMENT command adds one or more XML schema documents to an existing but incomplete XML schema.

TO *relational-identifier*

Specifies the relational name of a registered, but incomplete, XML schema to which additional schema documents are to be added.

The schema of the relational identifier must be SYSXSR. If you specify a qualified name, the qualifier must be SYSXSR, such as, SYSXSR.MYSCHEMA. If you specify an unqualified name, you need to execute the SQL statement SET SCHEMA="SYSXSR" before you execute the command. A name that is enclosed in quotation marks, such as "SYSXSR.MYSCHEMA," is considered an unqualified name. Qualifiers or schema names that are enclosed in quotation marks are not folded to uppercase. Qualifiers or schema names that are not enclosed in quotation marks are folded to uppercase.

ADD *schemaLocation-URI*

Specifies the schema location URI of an XML schema document that is to be added to this schema, as the document is likely to be referenced from another XML document.

FROM *content-URI*

Specifies the URI where the actual content of an XML schema document is located. The command line processor supports only file URIs, which begin with file://.

WITH *properties-URI*

Specifies that the URI of a properties document is to be associated with a schema document. The command line processor supports only file URIs, which begin with file://.

COMPLETE

Indicates that no more XML schema documents need to be associated with this XML schema, other than those that are indicated in this ADD XML SCHEMA DOCUMENT command. Validation of the schema is to be performed, and, if no errors are found, the schema is to be marked as usable. Until XML schema registration is completed, the schema is not visible to or usable in other SQL or XML commands.

WITH *schema-properties-URI*

Specifies the URI of a properties document to be associated with this XML schema. The command line processor supports only file URIs, which begin with file://. A schema properties document can be specified only when the XML schema is also being completed.

ENABLE DECOMPOSITION

Indicates that this schema is to be used for the purpose of decomposing XML documents. This option can be specified only when the XML schema is also being completed.

Examples

Example: Adding documents to an XML schema and completing schema registration

An XML schema that is referred to by the relational name JOHNDOE.PRODSHEMA1 already is registered. Two more documents need to be added to the list of schema documents associated with the schema. The first document is [http:// mycompany.com/xml/schema/order.xsd](http://mycompany.com/xml/schema/order.xsd), which is stored locally in /u/temp. The second document is [http:// othercompany.com/external/po.xsd](http://othercompany.com/external/po.xsd), which is also stored locally in /u/temp. Neither document has an associated properties file, and you are certain that no other documents are referenced by the schema. Issue these commands to add the documents and complete registration:

```
ADD XMLSCHEMA DOCUMENT TO JOHNDOE.PRODSHEMA1
ADD http://mycompany.com/xml/schema/order.xsd
FROM file:///u/temp/order.xsd
ADD http://othercompany.com/external/po.xsd
FROM file:///u/temp/po.xsd
COMPLETE
```

Example: Adding documents to an XML schema without completing schema registration

An XML schema that is referred to by the relational name JOHNDOE.TEST is registered, and you need to add a single document without completing the registration. The schema document is [http:// johndoe.com/test/test3.xsd](http://johndoe.com/test/test3.xsd) and it is stored locally in /usr/jdoe/test/test3.xsd. Issue this command to add the document:

```
ADD XMLSCHEMA DOCUMENT TO JOHNDOE.TEST
ADD http://johndoe.com/test/test3.xsd
FROM file:///usr/jdoe/test/test3.xsd
```

Related concepts

[XML schema management with the XML schema repository \(XSR\) \(Db2 Programming for XML\)](#)

Chapter 109. BIND (Db2 command line processor)

The BIND command binds DBRMs that are in hierarchical file system (HFS) files into a package.

►► BIND — *file-name* — -collection — *collection-name* — *bind-options* —◄◄

file-name

The absolute or relative path name of the file that contains a DBRM.

collection-name

The name of the package collection into which you want to bind the DBRM.

bind-options

Specifies one or more of the bind options that are listed in Chapter 14, “[BIND and REBIND options for packages, plans, and services](#),” on page 77. Bind options must be separated by spaces.

Examples

Example: Binding a package with the command line processor

Suppose that you compiled a C language Db2 application whose full path name is /u/usrt005/APP01.c. The compilation process created a DBRM named /u/usrt005/APP01.dbrm. You want to bind the DBRM into package collection PKG01, with bind options ISOLATION(CS) and RELEASE(DEALLOCATE). Use this command to perform the bind:

```
BIND /u/usrt005/APP01.dbrm -collection PKG01 ISOLATION(CS) RELEASE(DEALLOCATE)
```

Related reference

[BIND and REBIND options for packages, plans, and services](#)

There are several options you can use for binding or rebinding packages, plans, and services. Some of the options are common for both BIND and REBIND operations.

Chapter 110. CHANGE ISOLATION (Db2 command line processor)

The CHANGE ISOLATION command changes the isolation level for SQL statements that the command line processor executes.

See [“ISOLATION bind option” on page 117](#) for the meanings of the isolation levels.

During the command line processor session, the CHANGE ISOLATION command overrides the isolation value that is set in the IsolationLevel property in the command line processor properties file. The CHANGE ISOLATION command cannot be executed if a transaction is active.

Related tasks

[Choosing an ISOLATION option \(Db2 Performance\)](#)

Related reference

[ISOLATION bind option](#)

The ISOLATION option determines how far to isolate an application from the effects of other running applications.

[Properties file for the Db2 command line processor](#)

You can use a properties file to set your own defaults for Db2 command line processor properties.

Chapter 111. CHANGE MAXCOLUMNWIDTH (Db2 command line processor)

The CHANGE MAXCOLUMNWIDTH command changes the number of bytes in a table column that the Db2 command line processor returns.

➤ CHANGE MAXCOLUMNWIDTH — TO — *integer* ➤

integer

The maximum number of bytes in any column that is displayed after execution of:

- An SQL SELECT statement
- An SQL CALL statement that returns a result set
- A command line processor LIST TABLES, DESCRIBE TABLE, or DESCRIBE CALL command

This value overrides the value of the MaxColumnWidth command line processor property during the command line processor session.

Related reference

[Properties file for the Db2 command line processor](#)

You can use a properties file to set your own defaults for Db2 command line processor properties.

Chapter 112. CHANGE MAXLINESFROMSELECT (Db2 command line processor)

The CHANGE MAXLINESFROMSELECT command changes the number of rows that the command line processor returns.

► CHANGE MAXLINESFROMSELECT — TO — *integer* ◄

integer

The maximum number of rows that are displayed after execution of:

- An SQL SELECT statement
- An SQL CALL statement that returns a result set
- A command line processor LIST TABLES, DESCRIBE TABLE, or DESCRIBE CALL command

This value overrides the value of the MaxLinesFromSelect command line processor property during the command line processor session.

Related reference

[Properties file for the Db2 command line processor](#)

You can use a properties file to set your own defaults for Db2 command line processor properties.

Chapter 113. COMMIT (Db2 command line processor)

The command line processor COMMIT command commits all SQL work since the previous commit or rollback operation, and releases any database locks that are currently held by the active connection.

The Db2 command line processor COMMIT command performs the same function as the SQL COMMIT statement.

►► COMMIT ◄◄

Notes®

Implicit commit operation

By default, *autocommit mode* is enabled. This means that the command line processor implicitly issues a COMMIT statement after execution of every SQL statement. If an active connection exists, and you issue a new CONNECT command, the command line processor closes the currently active connection before making the new connection. When autocommit mode is enabled, the new connection can be established. However, if autocommit mode is disabled, you need to issue a COMMIT or ROLLBACK command before you issue the new CONNECT command. Otherwise, an error occurs.

Related reference

[COMMIT \(Db2 SQL\)](#)

Start syntax for the Db2 command line processor

You start the Db2 command line processor by running the Java program com.ibm.db2.clp.db2 from z/OS UNIX System Services.

Chapter 114. COMPLETE XMLSCHEMA (Db2 command line processor)

The COMPLETE XMLSCHEMA command completes the registration of an XML schema.

►► COMPLETE XMLSCHEMA — *relational-identifier* — WITH — *schema-properties-URI* — ►

relational-identifier

Specifies the relational name that was assigned to an XML schema in a previous REGISTER XMLSCHEMA command.

The schema of the relational identifier must be SYSXSR. If you specify a qualified name, the qualifier must be SYSXSR; for example, SYSXSR.MYSCHEMA. If you specify an unqualified name, you need to execute the SQL statement SET SCHEMA="SYSXSR" before you execute the command. A name that is enclosed in quotation marks, such as "SYSXSR.MYSCHEMA", is considered an unqualified name. Qualifiers or schema names that are enclosed in quotation marks are not folded to uppercase. Qualifiers or schema names that are not enclosed in quotation marks are folded to uppercase.

WITH schema-properties-URI

Specifies the URI of a properties document that is to be associated with this XML schema. The command line processor supports only file URIs, which begin with file://.

Example: Adding documents to an XML schema and completing schema registration

Suppose that a schema with relational name PRODSHEMA is already registered. The schema has additional properties that are stored locally in file /u/temp/CUSTPROP.xml. Issue this command to complete registration:

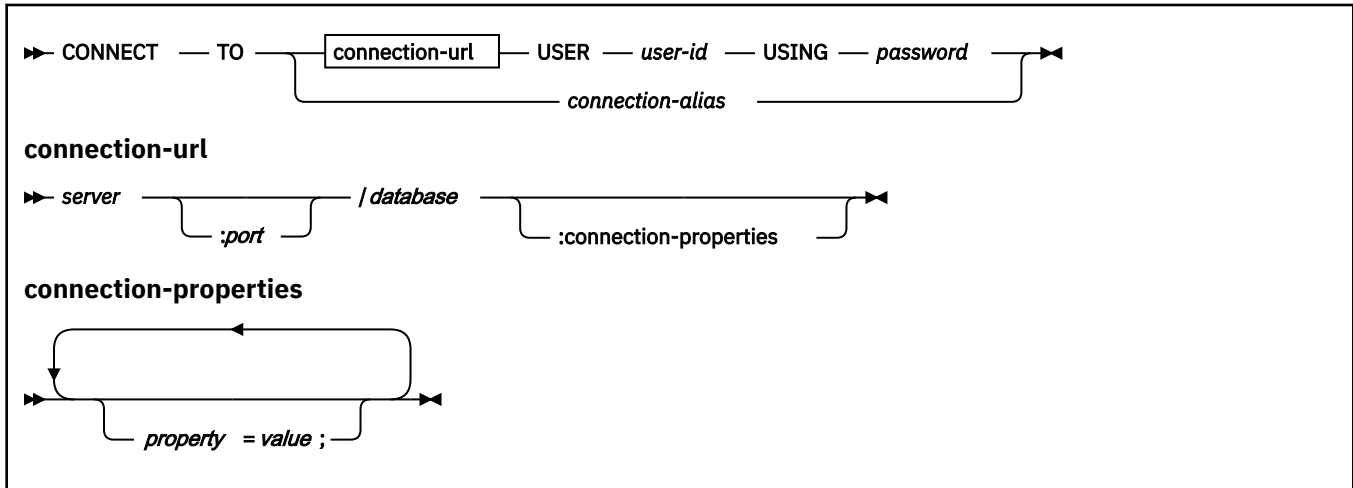

```
COMPLETE XMLSCHEMA PRODSHEMA WITH 'file:///u/temp/CUSTPROP.xml'
```

Related concepts

[XML schema management with the XML schema repository \(XSR\) \(Db2 Programming for XML\)](#)

Chapter 115. CONNECT (Db2 command line processor)

The CONNECT command establishes a connection to a Db2 server.

TO *connection-url*

Specifies the Db2 database system to which the connection is made. It consists of the following parts:

server

The domain name or IP address of the Db2 database system.

port

The TCP/IP server port number that is assigned to the Db2 database system. This is an integer between 0 and 65535. The default is 446.

database

A name for the Db2 database system. *database* is the Db2 location name that is defined during installation. All characters in the Db2 location name must be uppercase characters.

You can determine the location name by executing the following SQL statement on the Db2 database system to which you want to connect:

```
SELECT CURRENT SERVER FROM SYSIBM.SYSDUMMY1;
```

connection-properties

A list of IBM Data Server Driver for JDBC and SQLJ properties and their values. You can specify one or more property and value pairs. Each property and value pair, including the last one, must end with a semicolon (;). Do not include spaces or other white space characters anywhere within the list of property and value strings.

Specify connection properties only if your system administrator tells you to do so.

USER *user-id*

The authorization name to use when connecting to the Db2 server.

This name is case insensitive. However, if you run the LIST TABLES command to see your own tables, the case of *user-id* must match the case of the schema name for your tables. For example, if you connect to the Db2 database server with a user ID of myid, LIST TABLES does not list tables with a schema name of MYID.

USING *password*

The password for the authorization name that is used when connecting to the Db2 server.

connection-alias

A name that corresponds to an entry in the properties file that is defined by the CLPPROPERTIESFILE environment variable. That entry specifies the connection URL, user ID, and password for the connection.

Example: Making a connection for the command line processor by specifying a connection URL, ID and password

Suppose that your system administrator told you that the Db2 server against which you want to use the command line processor has the connection URL syszos1.abc.com:5021/ABCLOC1. Your ID is myid01 and your password is mypw01. Use this command to make a connection to that server:

```
CONNECT TO syszos1.abc.com:5021/ABCLOC1 USER myid01 USING mypw01
```

Example: Making a connection for the command line processor by specifying a connection alias

Suppose that the CLPPROPERTIESFILE environment variable specifies a file named clp.properties. In that file, the following connection alias is defined:

```
MYALIAS01=syszos1.abc.com:5021/ABCLOC1,myid01,mypw01
```

Use this command to make a connection using the connection alias:

```
CONNECT TO MYALIAS01
```

Example: Specifying a user ID and password or RACF PassTicket to run an SQL file

Suppose that you want to use the Db2 command line processor to connect to a server and your system administrator provides the following connection URL for the server: syszos1.abc.com:5021/ABCLOC1

You can create a file named script.sql that contains the following statement:

```
CONNECT TO syszos1.abc.com:5021/ABCLOC1
```

Also suppose that the alias db2 has been set for the Db2 command line processor name, and your user ID is myid01. If your password is mypw01, you can use the following command to connect to the server:

```
db2 -f script.sql -u myid01/mypw01
```

If your credential is the RACF PassTicket phrase TMOK73SJ, you can use the following command to connect to the server:

```
db2 -f script.sql -u myid01/TMOK73SJ
```

Related reference

[Properties for the IBM Data Server Driver for JDBC and SQLJ \(Db2 Application Programming for Java\)](#)

[Properties file for the Db2 command line processor](#)

You can use a properties file to set your own defaults for Db2 command line processor properties.

Chapter 116. DESCRIBE CALL (Db2 command line processor)

The DESCRIBE CALL command returns information about the parameters of a stored procedure.

For each parameter, DESCRIBE CALL returns the following information:

- Parameter name
- Parameter type: IN, OUT, or INOUT
- Data type
- Length
- Scale
- Nullability: yes, no, or unknown

```
➤ DESCRIBE CALL                      .procedure-name ➤
                  schema-name
```

schema-name

The schema name of the stored procedure for which parameter information is returned. The default is the user ID under which the command line processor session is running.

procedure-name

The name of the stored procedure for which parameter information is returned.

Example: Displaying parameter information for the SYSPROC.DSNUTILU stored procedure

Suppose that you want to display information about the Db2-supplied SYSPROC.DSNUTILU stored procedure. You do not want the output to wrap on your display, so you want the column widths in the output to be at most 12 bytes. Use these commands to set the column width and display the parameter information:

```
CHANGE MAXCOLUMNWIDTH TO 12
DISPLAY CALL SYSPROC.DSNUTILU
```

The following information is displayed:

COLUMN_NAME	COLUMN_TYPE	TYPE_NAME	PRECISION	LENGTH	SCALE	NULLABLE
UTILITY_ID	1	VARCHAR	16	16	<null>	0
RESTART	1	VARCHAR	8	8	<null>	0
UTSMT	1	CLOB	2147483647	2147483647	<null>	0
RETCODE	4	INTEGER	10	4	<null>	0

Mapping information for COLUMN_TYPE

- 0 - Unknown
- 1 - IN parameter
- 2 - INOUT parameter
- 3 - Result column in ResultSet
- 4 - OUT parameter
- 5 - Procedure return value

Mapping information for NULLABLE

- 0 - Does not allow NULL values

- 1 - Allow NULL values
- 2 - Nullability unknown

The CHANGE MAXCOLUMNWIDTH command changes the number of bytes in a table column that the Db2 command line processor returns.

[CALL \(Db2 SQL\)](#)

Chapter 117. DESCRIBE TABLE (Db2 command line processor)

The DESCRIBE TABLE command returns information about the columns of a table.

For each column, DESCRIBE TABLE returns the following information:

- Column name
- Table qualifier
- Data type
- Length
- Scale
- Nullability: yes, no, or unknown

➤ DESCRIBE TABLE  .table-name ➤

table-creator

The user ID of the table creator. The default is the user ID under which the command line processor session is running.

table-name

The name of the table for which column information is returned.

Example: Displaying column information for the DSN8C10.DEPT table

Suppose that you want to display information about Db2 sample table DSN8C10.DEPT. You do not want the output to wrap on your display, so you want the column widths in the output to be at most 14 bytes. Use these commands to set the column width and display the parameter information:

```
CHANGE MAXCOLUMNWIDTH TO 14
DESCRIBE TABLE DSN8C10.EMP
```

The following information is displayed:

COLUMN_ NAME	TABLE_SCHEM	TYPE_NAME	COLUMN_ SIZE	DECIMAL_ DIGITS	IS_NULLABLE
DEPTNO	DSN8C10	CHAR	3	<null>	NO
DEPTNAME	DSN8C10	VARCHAR	36	<null>	NO
MGRNO	DSN8C10	CHAR	6	<null>	YES
ADMRDEPT	DSN8C10	CHAR	3	<null>	NO
LOCATION	DSN8C10	INTEGER	16	<null>	YES

Related reference

The CHANGE MAXCOLUMNWIDTH command changes the number of bytes in a table column that the Db2 command line processor returns.

[CREATE TABLE \(Db2 SQL\)](#)

Chapter 118. DISCONNECT (Db2 command line processor)

The command line processor DISCONNECT command closes the current connection to a Db2 server.
DISCONNECT succeeds only if no transactions are in progress.

➤ DISCONNECT ➤

Related reference

[CONNECT \(Db2 command line processor\)](#)

The CONNECT command establishes a connection to a Db2 server.

Chapter 119. DISPLAY RESULT SETTINGS (Db2 command line processor)

The DISPLAY RESULT SETTINGS command lists the current settings for the maximum column width and the maximum number of rows that are returned for queries that the command line processor executes.

The values that are displayed correspond to the values of command line processor properties MaxColumnWidth and MaxLinesFromSelect, or the overrides that you specify with the CHANGE MAXCOLUMNWIDTH and CHANGE MAXLINESFROMSELECT commands.

►► DISPLAY RESULT SETTINGS ◄◄

Related reference

[Properties file for the Db2 command line processor](#)

You can use a properties file to set your own defaults for Db2 command line processor properties.

[CHANGE MAXLINESFROMSELECT \(Db2 command line processor\)](#)

The CHANGE MAXLINESFROMSELECT command changes the number of rows that the command line processor returns.

[CHANGE MAXCOLUMNWIDTH \(Db2 command line processor\)](#)

The CHANGE MAXCOLUMNWIDTH command changes the number of bytes in a table column that the Db2 command line processor returns.

Chapter 120. ECHO (Db2 command line processor)

The ECHO command writes the contents of a text string to the output stream.

The ECHO command is useful for generating labels in an output file.

►► ECHO — *string* ◄◄

Example: Use the ECHO command to identify a query in the output file

Suppose that you start the command line processor with the option -z output.txt. You connect to a Db2 server and execute these commands:

```
ECHO Find all tables that are not catalog tables:  
ECHO SELECT NAME FROM SYSIBM.SYSTABLES WHERE NAME NOT LIKE 'SYS%'  
SELECT NAME FROM SYSIBM.SYSTABLES WHERE NAME NOT LIKE 'SYS%'
```

output.txt contains output like this:

```
Find all tables that are not catalog tables:  
SELECT NAME FROM SYSIBM.SYSTABLES WHERE NAME NOT LIKE 'SYS%'  
NAME  
...  
ACT  
AGEGROUP  
AUX_BMP_PHOTO  
AUX_EMP_RESUME  
AUX_PSEG_PHOTO  
...
```

[Start syntax for the Db2 command line processor](#)

You start the Db2 command line processor by running the Java program com.ibm.db2.clp.db2 from z/OS UNIX System Services.

Chapter 121. LIST COMMAND OPTIONS (Db2 command line processor)

The LIST COMMAND OPTIONS command lists command line processor option flags, and indicates whether those option flags are set to ON or OFF.

►► LIST COMMAND OPTIONS ◄◄

Related reference

[Start syntax for the Db2 command line processor](#)

You start the Db2 command line processor by running the Java program com.ibm.db2.clp.db2 from z/OS UNIX System Services.

Chapter 122. LIST TABLES (Db2 command line processor)

The LIST TABLES command lists tables, views, or aliases on a Db2 server.

FOR USER

Displays a list of tables, views, and aliases with a schema name that matches the user ID of the user that issued the `CONNECT` command to connect the command line processor to a Db2 server. The case of the user ID in the `CONNECT` command must match the case of the `CREATOR` value in `SYSIBM.SYSTABLES` for a table to be listed. `FOR USER` is the default.

FOR SYSTEM

Displays a list of catalog tables on the Db2 server.

FOR ALL

Displays a list of all tables, views, and aliases on the Db2 server.

FOR SCHEMA *schema-name*

Displays a list of all tables, views, and aliases with a schema name that matches *schema-name*.

Example: Listing tables, views, and aliases for the currently connected user

Suppose that you connected the command line processor to a Db2 server with user ID `ADMF001`. You want to display a list of tables, views, and aliases with a schema name of `ADMF001`. You do not want the output to wrap on your display, so you set the column widths on the display to at most 14 bytes. Use these commands to set the column width and display the list.

```
CHANGE MAXCOLUMNWIDTH TO 14
LIST TABLES
```

Information like this is displayed:

TABLE_SCHEM	TABLE_NAME	TABLE_TYPE
ADMF001	MYALIAS01	SYNONYM
ADMF001	MYTABLE01	TABLE
ADMF001	MYTABLE02	TABLE
ADMF001	MYVIEW01	VIEW

Example: Listing tables, views, and aliases for a specified schema name

Suppose that you want to display a list of tables, views, and aliases with a schema name of `DSN8C10`. You do not want the output to wrap on your display, and you do not want columns of up to 30 bytes to be truncated, so you set the column widths on the display to at most 30 bytes. Use these commands to set the column width and display the list.

```
CHANGE MAXCOLUMNWIDTH TO 30
LIST TABLES FOR SCHEMA DSN8C10
```

Information like this is displayed:

TABLE_SCHEM	TABLE_NAME	TABLE_TYPE
DSN8C10	AUX_BMP_PHOTO	AUXILIARY TABLE
DSN8C10	AUX_EMP_RESUME	AUXILIARY TABLE
DSN8C10	AUX_PSEG_PHOTO	AUXILIARY TABLE
DSN8C10	DSN_QUERY_AUX	AUXILIARY TABLE
DSN8C10	DSN_STATEMENT_CACHE_AUX	AUXILIARY TABLE

...

Related reference

The CHANGE MAXCOLUMNWIDTH command changes the number of bytes in a table column that the Db2 command line processor returns.

[CONNECT \(Db2 command line processor\)](#)

The CONNECT command establishes a connection to a Db2 server.

[SYSTABLES catalog table \(Db2 SQL\)](#)

Chapter 123. REGISTER XMLSCHEMA (Db2 command line processor)

The REGISTER XMLSCHEMA command registers an XML schema with the Db2 database manager.

schemaLocation-URI-1

Specifies the schema location URI of the XML schema that is to be registered. The schema location is referenced from XML instance documents or the SQL XML schema validation function. If a single XML schema references multiple schema documents, each XML schema document other than the primary document must also be registered. Each document can be registered in either the sub-document clause in the REGISTER XMLSCHEMA command or in a separate ADD XMLSCHEMA DOCUMENT command.

FROM content-URI

Specifies the URI where the actual content of an XML schema document is located. The command line processor supports only file URIs, which begin with file://. The XML schema document must be in the Unicode encoding scheme.

WITH properties-URI

Specifies the URI of a properties document that are to be associated with a schema document. The command line processor supports only file URIs, which begin with file://.

AS relational-identifier

Specifies a name that can be used to refer to the XML schema in relational SQL or XML.

The schema of the relational identifier must be SYSXSR. If you specify a qualified name, the qualifier must be SYSXSR; for example, SYSXSR.MYSCHEMA. If you specify an unqualified name, you need to execute the SQL statement SET SCHEMA="SYSXSR" before you execute the command. A name that is enclosed in quotation marks, such as "SYSXSR.MYSCHEMA", is considered as an unqualified name. Qualifiers or schema names that are enclosed in quotation marks are not folded to uppercase. Qualifiers or schema names that are not enclosed in quotation marks are folded to uppercase.

ADD schemaLocation-URI-2

Specifies the schema location URI of a related XML schema document, as it is referenced by this XML schema document.

COMPLETE

Indicates that there are no more XML schema documents to be associated with this XML schema. Validation of the schema is performed, and if there are no errors are found, the schema is to be marked as usable. Until XML schema registration is completed, the schema is not visible to or usable in other SQL or XML commands.

WITH *schema-properties-URI*

Specifies the URI of a properties document that is to be associated with this XML schema. The CLP supports only file URIs, which begin with file://. A schema properties document can be specified only when the XML schema is also being completed.

Example: Registering and completing an XML schema with a single XML schema document

Suppose that you want to register an XML schema named `http://mycompany.com/prod/p1_1.xsd`, and to make it available immediately. The content of the XML schema is a single document that has file URI `file:///u/temp/p1_1.xsd`. In SQL statements, you want to refer to the XML schema as `EXAMPLE.TEST1`. Use the following command to register and complete the XML schema.

```
REGISTER XMLSCHEMA http://mycompany.com/prod/p1_1.xsd
FROM file:///u/temp/p1_1.xsd AS EXAMPLE.TEST1 COMPLETE
```

Example: Registering and completing an XML schema with multiple XML schema documents

Suppose that you want to register an XML schema named `http://mycompany.com/prod/cust.xsd`, and to make it available immediately. The content of the XML schema consists of three documents. The contents of the three documents are locally stored as `file:///u/temp/cust1.xsd`, `file:///u/temp/cust2.xsd`, and `file:///u/temp/cust3.xsd`. The schema location URIs for the documents are `http://mycompany.com/prod/cust1.xsd`, `http://mycompany.com/prod/cust2.xsd`, and `http://mycompany.com/prod/cust3.xsd`. In SQL statements, you want to refer to the XML schema as `PRODSHEMA`. Additional properties for the XML schema are stored in a file with file URI `file:///u/temp/CUSTPROP.XML`. Use following to register and complete the XML schema.

```
REGISTER XMLSCHEMA http://mycompany.com/prod/cust.xsd
FROM file:///u/temp/cust.xsd'
AS PRODSHEMA WITH file:///u/temp/CUSTPROP.XML
ADD http://mycompany.com/prod/cust1.xsd
FROM file:///u/temp/cust1.xsd
ADD http://mycompany.com/prod/cust2.xsd
FROM file:///u/temp/cust2.xsd
ADD http://mycompany.com/prod/cust3.xsd
FROM file:///u/temp/cust3.xsd
COMPLETE
```

Related concepts

[XML schema management with the XML schema repository \(XSR\) \(Db2 Programming for XML\)](#)

Chapter 124. REMOVE XMLSCHEMA (Db2 command line processor)

The REMOVE XMLSCHEMA command deletes a previously registered XML schema from the XML schema repository.

►► REMOVE XMLSCHEMA — *relational-identifier* ◄◄

relational-identifier

Specifies a name that is used to refer to the XML schema in relational SQL or XML. This value is the relational identifier that you used when you registered the XML schema.

The relational identifier has the qualifier SYSXSR. If you specify REMOVE XMLSCHEMA with an unqualified relational identifier, you must have previously executed a SET SCHEMA SQL statement to set the schema name to SYSXSR.

Example: Removing an XML schema from the XML schema repository

Suppose that you want to remove an XML schema with relational identifier SYSXSR.PRODSHEMA from the XML schema repository. Run this command:

```
REMOVE XMLSCHEMA SYSXSR.PRODSHEMA
```

Related concepts

[XML schema management with the XML schema repository \(XSR\) \(Db2 Programming for XML\)](#)

Chapter 125. ROLLBACK (Db2 command line processor)

The ROLLBACK command rolls back all SQL work since the previous commit or rollback operation, and releases any database locks that are currently held by the active connection.

The Db2 command line processor COMMIT command performs the same function as the SQL ROLLBACK statement.

►► ROLLBACK ◄◄

Notes

ROLLBACK and autocommit mode

If autocommit mode is enabled, the ROLLBACK command has no effect.

Related reference

[COMMIT \(Db2 SQL\)](#)

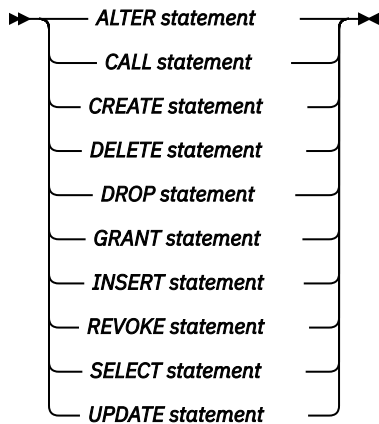

Start syntax for the Db2 command line processor

You start the Db2 command line processor by running the Java program com.ibm.db2.clp.db2 from z/OS UNIX System Services.

Chapter 126. SQL statements (Db2 command line processor)

Execute SQL statements in the Db2 command line processor after you issue the CONNECT command.

The SQL statements that can be executed in the command line processor have the same syntax as SQL statements that are executed in application programs.

Notes

Specifying output parameters in a CALL statement

To specify an output parameter in a CALL statement, use a question mark (?).

Examples

Example: Executing a query with the command line processor

Suppose that the sample tables are installed on a Db2 server with connection URL syszos1.abc.com:5021/ABCLOC1. Use the following commands to connect to that server, and issue a SELECT statement to display all the rows in the sample employee table.

```
CONNECT TO syszos1.abc.com:5021/ABCLOC1 USER myid01 USING mypw01
SELECT * FROM DSN8C10.EMP
```

Example: Calling a stored procedure with the command line processor

Suppose that you want to display information about all of the subsystem parameters, application programming defaults, and IRLM parameters for a Db2 server. The Db2-supplied stored procedure SYSPROC.ADMIN_INFO_SYSPARM provides that information. Use the following commands to connect to the server, and call the stored procedure.

```
CONNECT TO syszos1.abc.com:5021/ABCLOC1 USER myid01 USING mypw01
CALL SYSPROC.ADMIN_INFO_SYSPARM(NULL,?,?)
```

You start the Db2 command line processor by running the Java program com.ibm.db2.clp.db2 from z/OS UNIX System Services.

Chapter 128. z/OS UNIX System Services (Db2 command line processor)

The z/OS UNIX System Services command can be run in the command line processor can be run by preceding the command with an exclamation mark (!).

►► ! — *uss-command* ◄◄

!

Indicates that the text that follows is a this is a z/OS UNIX System Services command.

uss-command

Any z/OS UNIX System Services command.

Examples

Example: Listing files in the current directory

Suppose that you are in a command line processor session, and you need to run the z/OS ls command to obtain a list of files in the current directory. Run this command:

```
!ls
```

Chapter 129. UPDATE COMMAND OPTIONS (Db2 command line processor)

The UPDATE COMMAND OPTIONS command changes property values for properties that have a value of ON or OFF.

option-flag

One of the following option flags:

- a
- c
- o
- s
- v
- x
- z (OFF only)

See Chapter 102, “Start syntax for the Db2 command line processor,” on page 551 for the meaning of each option flag.

property-keyword

One of the following option flags:

- DisplaySQLCA
- AutoCommit
- DisplayOutput
- StopOnError
- Echo
- StripHeaders

See Chapter 103, “Properties file for the Db2 command line processor,” on page 555 for the meaning of each property keyword.

Related reference

Programming interface information

This information is intended to help you to plan for and administer Db2 12 for z/OS. This information primarily documents General-use Programming Interface and Associated Guidance Information provided by Db2 12 for z/OS. This information also documents Product-sensitive Programming Interface and Associated Guidance Information provided by Db2 12 for z/OS.

General-use Programming Interface and Associated Guidance Information

General-use Programming Interfaces allow the customer to write programs that obtain the services of Db2 12 for z/OS.

Product-sensitive Programming Interface and Associated Guidance Information

Product-sensitive Programming Interfaces allow the customer installation to perform tasks such as diagnosing, modifying, monitoring, repairing, tailoring, or tuning of this IBM software product. Use of such interfaces creates dependencies on the detailed design or implementation of the IBM software product. Product-sensitive Programming Interfaces should be used only for these specialized purposes. Because of their dependencies on detailed design and implementation, it is to be expected that programs written to such interfaces may need to be changed in order to run with new product releases or versions, or as a result of service.

Product-sensitive Programming Interface and Associated Guidance Information is identified where it occurs by the following markings:

 Product-sensitive Programming Interface and Associated Guidance Information... 

Trademarks

IBM, the IBM logo, and ibm.com® are trademarks or registered marks of International Business Machines Corp., registered in many jurisdictions worldwide. Other product and service names might be trademarks of IBM or other companies. A current list of IBM trademarks is available on the web at "Copyright and trademark information" at: <http://www.ibm.com/legal/copytrade.shtml>.

Linux is a registered trademark of Linus Torvalds in the United States, other countries, or both.

Microsoft, Windows, Windows NT, and the Windows logo are trademarks of Microsoft Corporation in the United States, other countries, or both.

UNIX is a registered trademark of The Open Group in the United States and other countries.

Java and all Java-based trademarks and logos are trademarks or registered trademarks of Oracle and/or its affiliates.

Terms and conditions for product documentation

Permissions for the use of these publications are granted subject to the following terms and conditions:

Applicability: These terms and conditions are in addition to any terms of use for the IBM website.

Personal use: You may reproduce these publications for your personal, noncommercial use provided that all proprietary notices are preserved. You may not distribute, display or make derivative work of these publications, or any portion thereof, without the express consent of IBM.

Commercial use: You may reproduce, distribute and display these publications solely within your enterprise provided that all proprietary notices are preserved. You may not make derivative works of these publications, or reproduce, distribute or display these publications or any portion thereof outside your enterprise, without the express consent of IBM.

Rights: Except as expressly granted in this permission, no other permissions, licenses or rights are granted, either express or implied, to the publications or any information, data, software or other intellectual property contained therein.

IBM reserves the right to withdraw the permissions granted herein whenever, in its discretion, the use of the publications is detrimental to its interest or, as determined by IBM, the above instructions are not being properly followed.

You may not download, export or re-export this information except in full compliance with all applicable laws and regulations, including all United States export laws and regulations.

IBM MAKES NO GUARANTEE ABOUT THE CONTENT OF THESE PUBLICATIONS. THE PUBLICATIONS ARE PROVIDED "AS-IS" AND WITHOUT WARRANTY OF ANY KIND, EITHER EXPRESSED OR IMPLIED, INCLUDING BUT NOT LIMITED TO IMPLIED WARRANTIES OF MERCHANTABILITY, NON-INFRINGEMENT, AND FITNESS FOR A PARTICULAR PURPOSE.

Privacy policy considerations

IBM Software products, including software as a service solutions, ("Software Offerings") may use cookies or other technologies to collect product usage information, to help improve the end user experience, to tailor interactions with the end user, or for other purposes. In many cases no personally identifiable information is collected by the Software Offerings. Some of our Software Offerings can help enable you to collect personally identifiable information. If this Software Offering uses cookies to collect personally identifiable information, specific information about this offering's use of cookies is set forth below.

This Software Offering does not use cookies or other technologies to collect personally identifiable information.

If the configurations deployed for this Software Offering provide you as customer the ability to collect personally identifiable information from end users via cookies and other technologies, you should seek your own legal advice about any laws applicable to such data collection, including any requirements for notice and consent.

For more information about the use of various technologies, including cookies, for these purposes, see IBM's Privacy Policy at <http://www.ibm.com/privacy> and IBM's Online Privacy Statement at <http://www.ibm.com/privacy/details> the section entitled "Cookies, Web Beacons and Other Technologies" and the "IBM Software Products and Software-as-a-Service Privacy Statement" at <http://www.ibm.com/software/info/product-privacy>.

 - DSNU100I [290](#)
 - DSNU105I [290](#)
 - DSNU106I [290](#)
 - DSNW133I [476](#)
- MLT option of MODIFY irlmproc,SET command of z/OS [360, 457](#)
- MODE option
 - ARCHIVE LOG command [46](#)
 - STOP DB2 command [503](#)
 - STOP DDF command [505](#)
- MODIFY admtproc
 - shutdown [345](#)
 - Trace [347](#)
- MODIFY admtproc command of
 - z/OS
 - Examples [347](#)
- MODIFY admtproc,,APPL=SHUTDOWN command of
 - z/OS
 - description [345](#)
- MODIFY admtproc,,APPL=TRACE command of
 - z/OS
 - description [347](#)
- MODIFY admtproc,APPL=SHUTDOWN command of
 - z/OS
 - Examples [345](#)
- MODIFY DDF [349](#)
- MODIFY DDF command [349](#)
- MODIFY irlmproc,ABEND command of
 - z/OS
 - description [353](#)
 - Example [353](#)
- MODIFY irlmproc,DIAG command of
 - z/OS
 - description [355](#)
 - Example [356](#)
- MODIFY irlmproc,PURGE command of
 - z/OS
 - description [357](#)
 - Example [357](#)
- MODIFY irlmproc,SET command of
 - z/OS
 - description [359](#)
 - example [361](#)
 - option descriptions [357, 359](#)
- MODIFY irlmproc,STATUS command of
 - z/OS
 - description [363](#)
 - example [365](#)
 - Option descriptions [363](#)
- MODIFY RECOVERY utility, effects of TERM command [543](#)
- MODIFY STATISTICS utility, effects of TERM command [543](#)
- MODIFY TRACE command

- MODIFY TRACE command (*continued*)
 - description [369](#)
 - Example [371](#)
- modifying [349](#)
- MONITOR option
 - DISPLAY TRACE command [282](#)
 - MODIFY TRACE command [370](#)
 - STOP TRACE command [534](#)
- monitor trace
 - displaying [279](#)
 - starting [471](#)
 - stopping [531](#)
- MSTR option of START DB2 command [443](#)

N

- NAME bind option [120](#)
- NAMES option of DCLGEN subcommand [158](#)
- NEWFUN option of DSNH command [312](#)
- NEWLOG option
 - SET LOG command [417](#)
- NID (network ID) option of RECOVER INDOUBT command [396](#)
- nnn option
 - START irlmproc command [458](#)
- NO LIMIT option of SET ARCHIVE command [414](#)
- NO option
 - START irlmproc command [458](#)
- NOBACKOUT option of CANCEL THREAD command [150](#)
- NODEFER option
 - BIND PACKAGE subcommand [97](#)
 - BIND PLAN subcommand [97](#)
 - DSNH command [320](#)
 - REBIND PACKAGE subcommand [97](#)
 - REBIND PLAN subcommand [97](#)
- NODISCON option of START irlmproc command [458](#)
- NODUMP option of MODIFY irlmproc, ABEND command [353](#)
- NOFOR option of DSNH command [312](#)
- NOINDOUBTS option
 - START DB2 command [441](#)
- NONE keyword of MODIFY irlmproc, DIAG command [356](#)
- NOWRAP option of TRACE CT command [545](#)

O

- ONLY option of DISPLAY DATABASE command [200](#)
- OP option
 - START TRACE command [476](#)
 - STOP TRACE command [535](#)
- operands, Db2 commands [3](#)
- OPTHINT option
 - BIND PACKAGE subcommand [121](#)
 - BIND PLAN subcommand [121](#)
 - DSNH command [320](#)
 - REBIND PACKAGE subcommand [121](#)
 - REBIND PLAN subcommand [121](#)
- options for starting [551](#)
- OPTIONS option
 - DSNH command [312](#)
- OUTNAME option of DSNH command [312](#)
- OVERVIEW option of DISPLAY DATABASE command [201](#)
- OWNER option
 - BIND PACKAGE subcommand [122](#)

- OWNER option (*continued*)
 - BIND PLAN subcommand [122](#)
 - DCLGEN subcommand [157](#)
 - DSNH command [320](#)
 - REBIND PACKAGE subcommand [122](#)
 - REBIND PLAN subcommand [122](#)

P

- P irlmproc command. [515](#)
- package
 - binding, initiating [51](#)
 - identifier
 - BIND PACKAGE subcommand [123](#)
 - REBIND TRIGGER PACKAGE subcommand [389](#)
 - rebinding [373](#)
 - rebinding trigger [387](#)
 - replacing version of [80](#)
- PACKAGE option of DSNH command [323](#)
- PACTION option of DSNH command [321](#)
- parallel processing
 - DEGREE option of bind subcommands [99](#)
 - VPPSEQT option of ALTER BUFFERPOOL command [31](#)
- parameter, passing to application program [410](#)
- PARM option of START DB2 command [442](#)
- PARMS option
 - DSNH command [312](#)
 - RUN subcommand [410](#)
- parsing rules, Db2 commands [3](#)
- PART option
 - DISPLAY DATABASE command [200](#)
 - START DATABASE command [435](#)
 - STOP DATABASE command [499](#)
- partial-location name, DISPLAY LOCATION command [236](#)
- PASS option of DSNH command [313](#)
- PATH option
 - BIND PACKAGE subcommand [124](#)
 - BIND PLAN subcommand [124](#)
 - DSNH command [320](#)
 - REBIND PACKAGE subcommand [124](#)
 - REBIND PLAN subcommand [124](#)
- PATHDEFAULT option
 - REBIND PACKAGE subcommand [125](#)
 - REBIND PLAN subcommand [125](#)
- PBIND option of DSNH command [321](#)
- PC option of START irlmproc command [457](#)
- PCICS option of DSNH command [321](#)
- PCLOAD option of DSNH command [313](#)
- PDBPROTOCOL option of DSNH command [322](#)
- PDBRMLIB option of DSNH command [322](#)
- PDEFER option of DSNH command [322](#)
- PDEGREE option of DSNH command [322](#)
- PDISABLE option of DSNH command [322](#)
- PDLIBATCH option of DSNH command [322](#)
- PDMEM option of DSNH command [322](#)
- PDYNAMICRULES option of DSNH command [322](#)
- PENABLE option of DSNH command [322](#)
- PERFM option
 - DISPLAY TRACE command [282](#)
 - MODIFY TRACE command [370](#)
 - STOP TRACE command [534](#)
- performance trace
 - displaying [279](#)
 - stopping [531](#)

- performance, trace
 - starting [471](#)
- PFLAG option of DSNH command [323](#)
- PGPROT option of START irlmproc command [458](#)
- PGSTEAL option of ALTER BUFFERPOOL command [32](#)
- phases of execution for DSNH processing [299](#)
- PIMSBMP option of DSNH command [323](#)
- PIMSMP option of DSNH command [323](#)
- PISOLATION option of DSNH command [323](#)
- PKEEPDYNAMIC option of DSNH command [323](#)
- PKGCOL option
 - DISPLAY TRACE command [282](#)
 - START TRACE command [477](#)
 - STOP TRACE command [534](#)
- PKGLOC option
 - DISPLAY TRACE command [282](#)
 - START TRACE command [477](#)
 - STOP TRACE command [534](#)
- PKGPROG option
 - DISPLAY TRACE command [282](#)

 - START TRACE command [477](#)
 - STOP TRACE command [534](#)
- PLANMGMT option
 - BIND PACKAGE subcommand [127](#)
 - REBIND PACKAGE subcommand [127](#)
 - REBIND TRIGGER PACKAGE subcommand [127](#)
- PLANMGMTSCOPE option
 - FREE PACKAGE subcommand [335](#)
- PLI option of DCLGEN subcommand [158](#)
- PLI2LIB option of DSNH command [313](#)
- PLIB option of DSNH command [313](#)
- PLILIB option of DSNH command [313](#)
- PLILOAD option of DSNH command [313](#)
- PLIPLNK option of DSNH command [313](#)
- PLIPMSG option of DSNH command [313](#)
- PLOCK keyword of MODIFY irlmproc,DIAG command [355](#)
- PnLIB option of DSNH command [313](#)
- PNODEFER option of DSNH command [323](#)
- POPTHINT option of DSNH command [323](#)
- POPTION option of DSNH command [314](#)
- POSTPONED option
 - DISPLAY THREAD command [268](#)
- postponed units of recovery, recovering [399](#)
- POWNER option of DSNH command [323](#)
- PPATH option of DSNH command [323](#)
- PQUALIFIER option of DSNH command [323](#)
- PRECOMP option of DSNH command [314](#)
- precompiler
 - (continued)*
 - DSNH command options [312](#)
 - invoking DSNH [299](#)
 - producing members for [120](#)
 - PRELEASE option of DSNH command [323](#)
 - PRELINK option of DSNH command [314](#)
 - PREOPT option of DSNH command [323](#)
 - PRINT option of DSNH command [314](#)
 - PROC option
 - DISPLAY THREAD command [268](#)
 - processing, parallel
 - VPPSEQT option of ALTER BUFFERPOOL command [31](#)
 - product-sensitive programming information, described [618](#)
 - PROGAUTH option
 - BIND PLAN subcommand [129](#)
 - REBIND PLAN subcommand [129](#)
 - PROGRAM option of RUN subcommand [409](#)
 - programming interface information, described [618](#)
 - PSECSPEC option of DSNH command [314](#)
 - PSPACE option of DSNH command [315](#)
 - PSPI symbols [618](#)
 - PVALIDATE option of DSNH command [323](#)
 - PVT option of MODIFY irlmproc,SET command of z/OS [360](#)

Q

- QUALIFIER option
 - BIND PACKAGE subcommand [130](#)
 - BIND PLAN subcommand [130](#)
 - DSNH command [321](#)
 - REBIND PACKAGE subcommand [130](#)
 - REBIND PLAN subcommand [130](#)
- query
 - binding [69](#)
